IAM Project

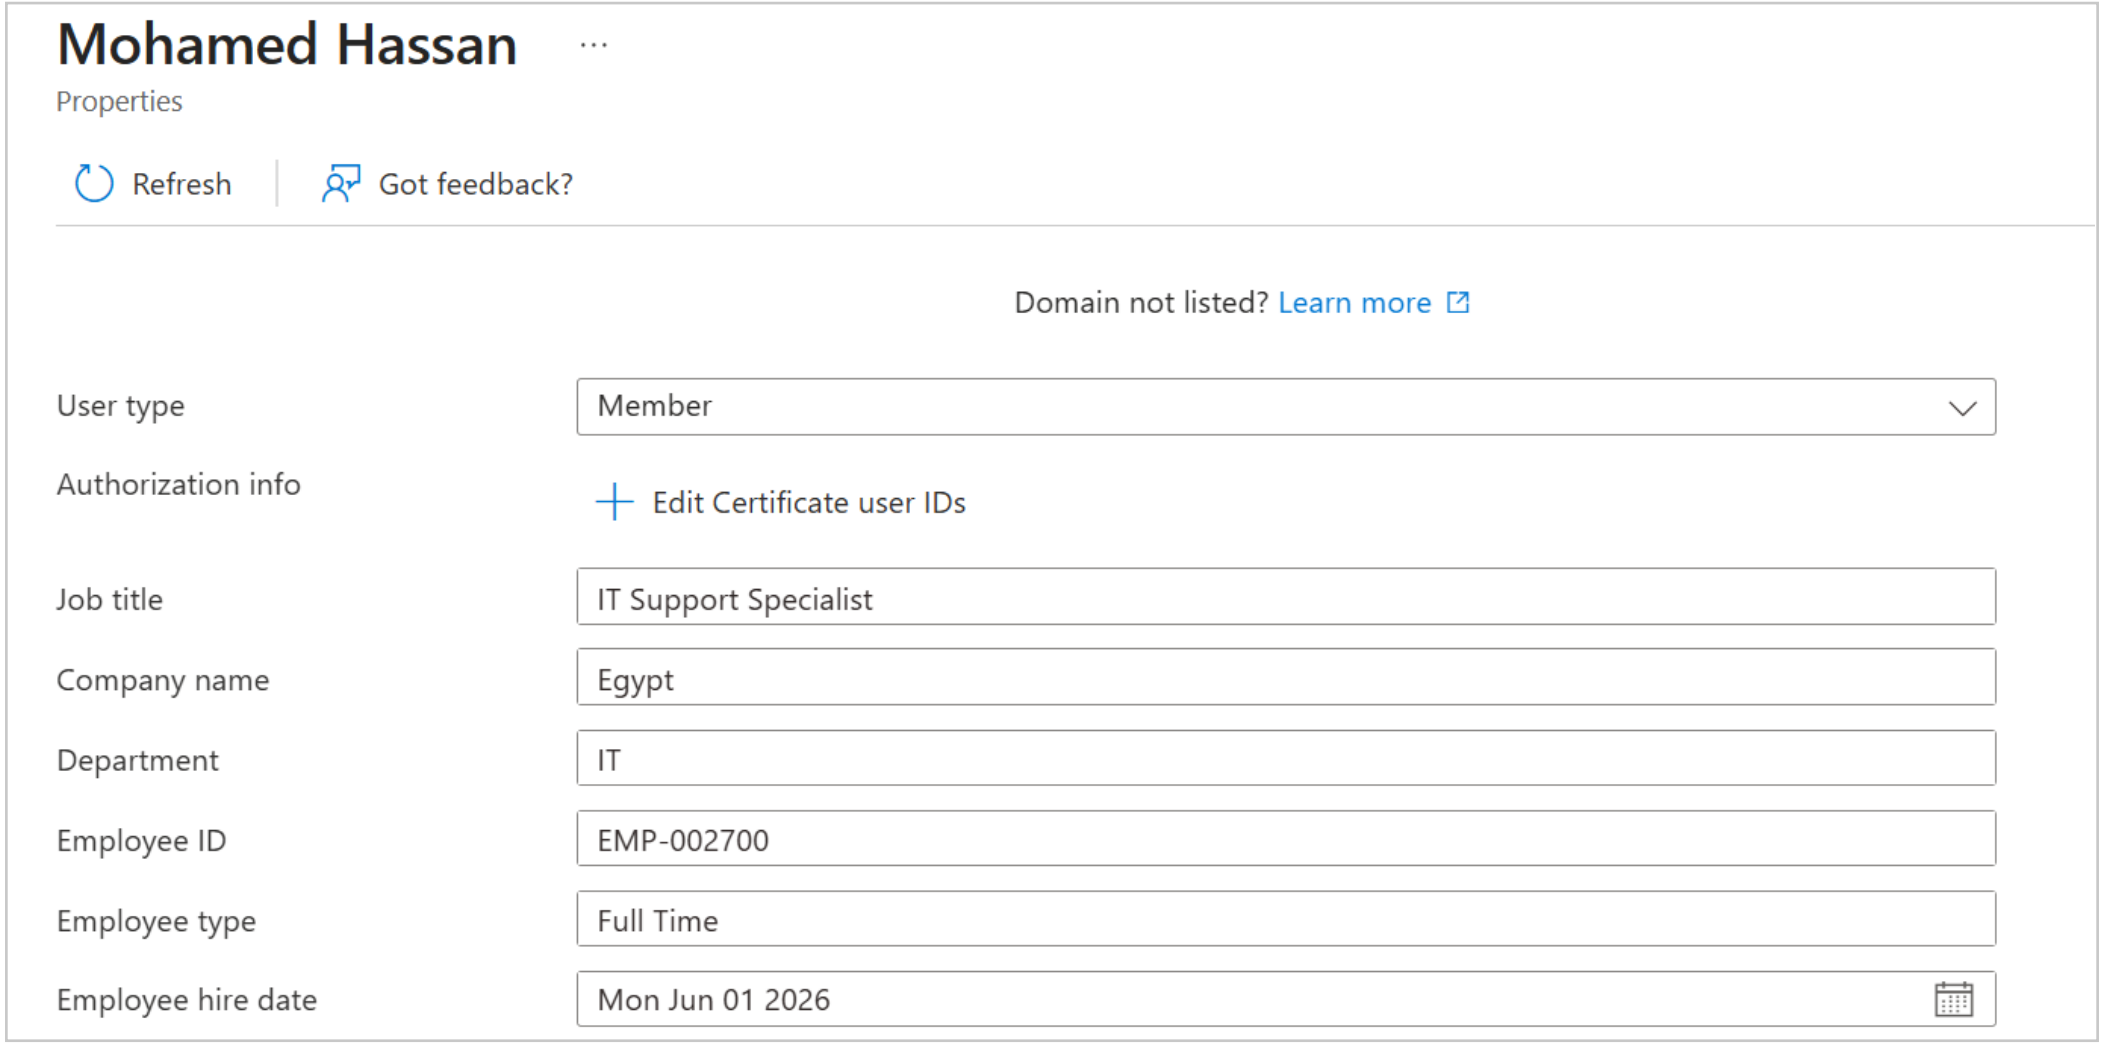

Fixing Permissions & Applying Least Privilege

Microsoft Entra ID

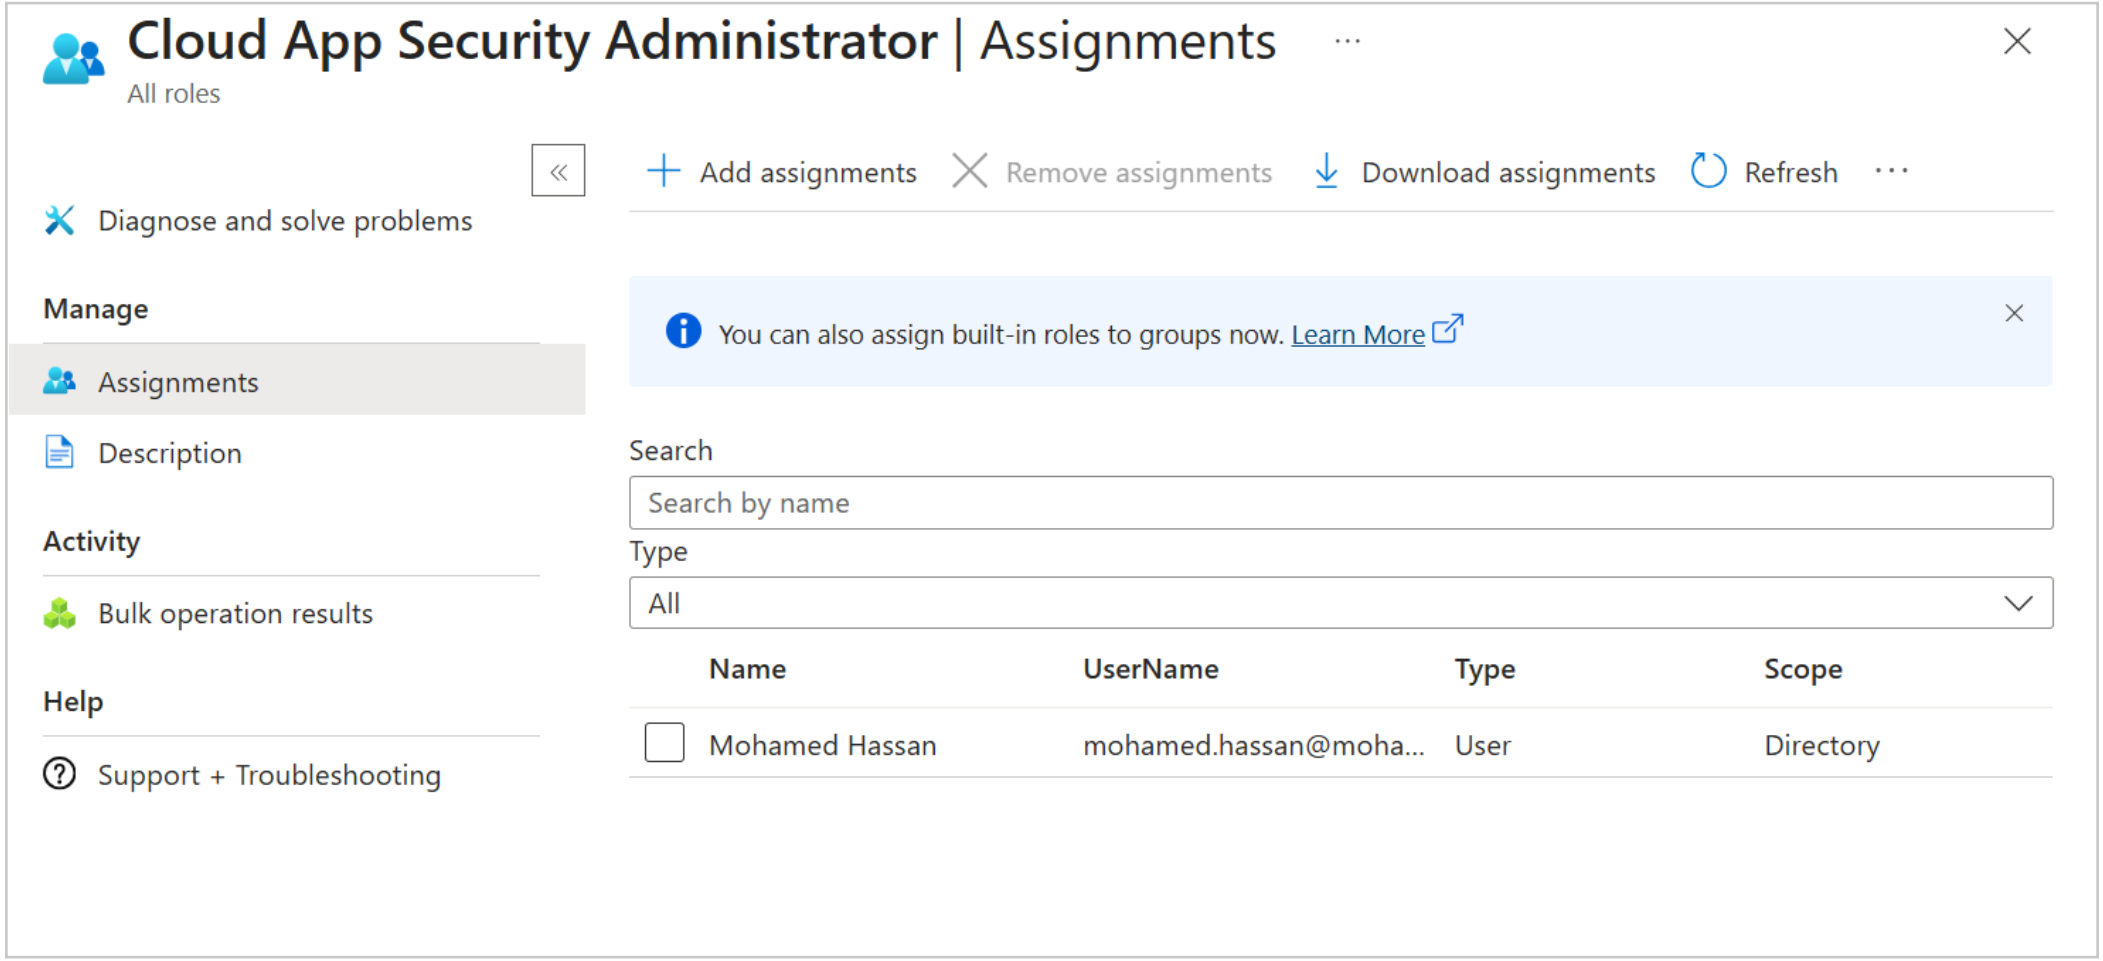

Project Summary: Before and After

User	Job Title	Role Before	Role After	Reason
Mohamed Hassan	IT Support Specialist	Cloud App Security Administrator	Helpdesk Administrator	Support work needs helpdesk rights, not cloud app security administration.
Sara Ali	Helpdesk Technician	Global Administrator	Helpdesk Administrator	Highest role was far beyond a technician's duties.
Omar Mohammed	Security Analyst	Security Reader	Security Reader	Already appropriate: analysts only need read access to security information, so no change was needed.
Nour Ahmed	HR Specialist	Global Reader	None	HR work needs no directory administrative access.
Ali Mahmoud	IT Manager	Global Administrator	User Administrator	Manages users and groups without full tenant control.

Result: every user now holds only the role their job requires. Global Administrator was removed from two users, Global Reader and Cloud App Security Administrator were removed from users who did not need them, and each user was given the least privileged role that fits their work (principle of least privilege).

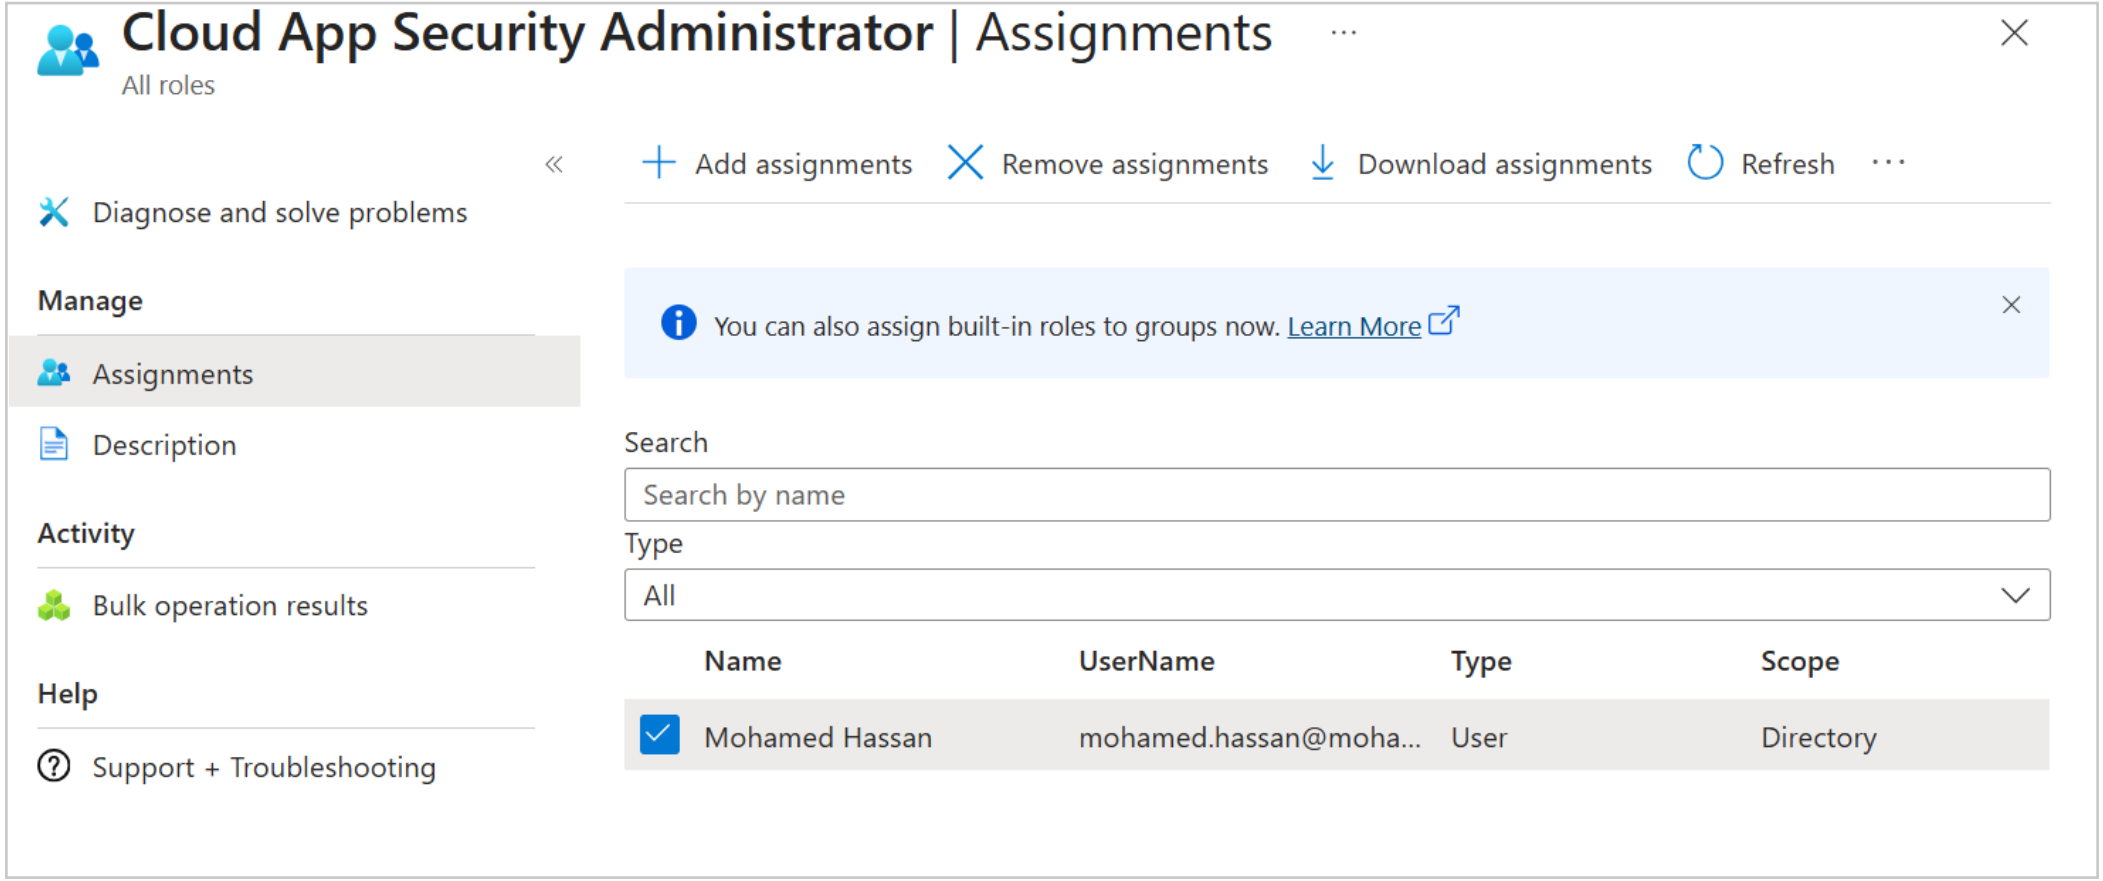

Employee profile: job title IT Support Specialist, IT department, Employee ID EMP-002700. The job role is the basis for deciding which permissions are appropriate.

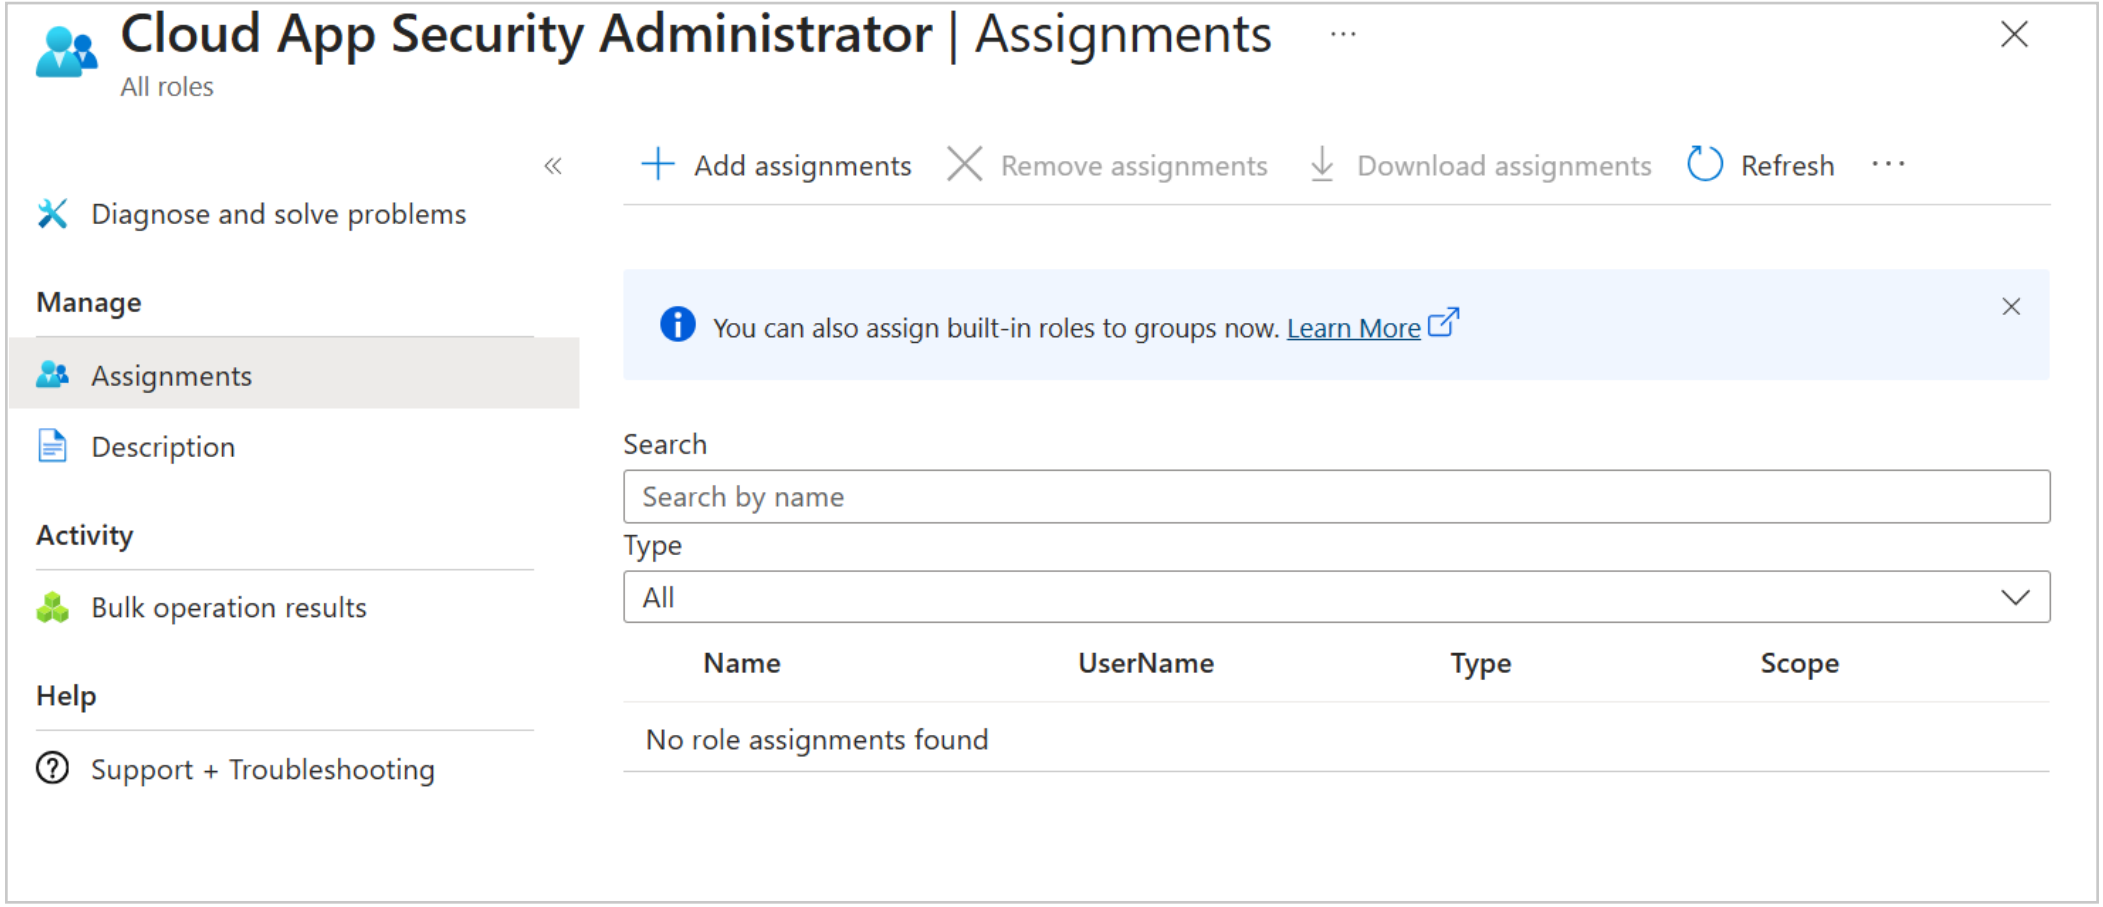

The Assignments page shows Mohamed Hassan holding the Cloud App Security Administrator role at Directory scope, which is not an appropriate permission for his job as an IT Support Specialist.

Selecting the User for Removal

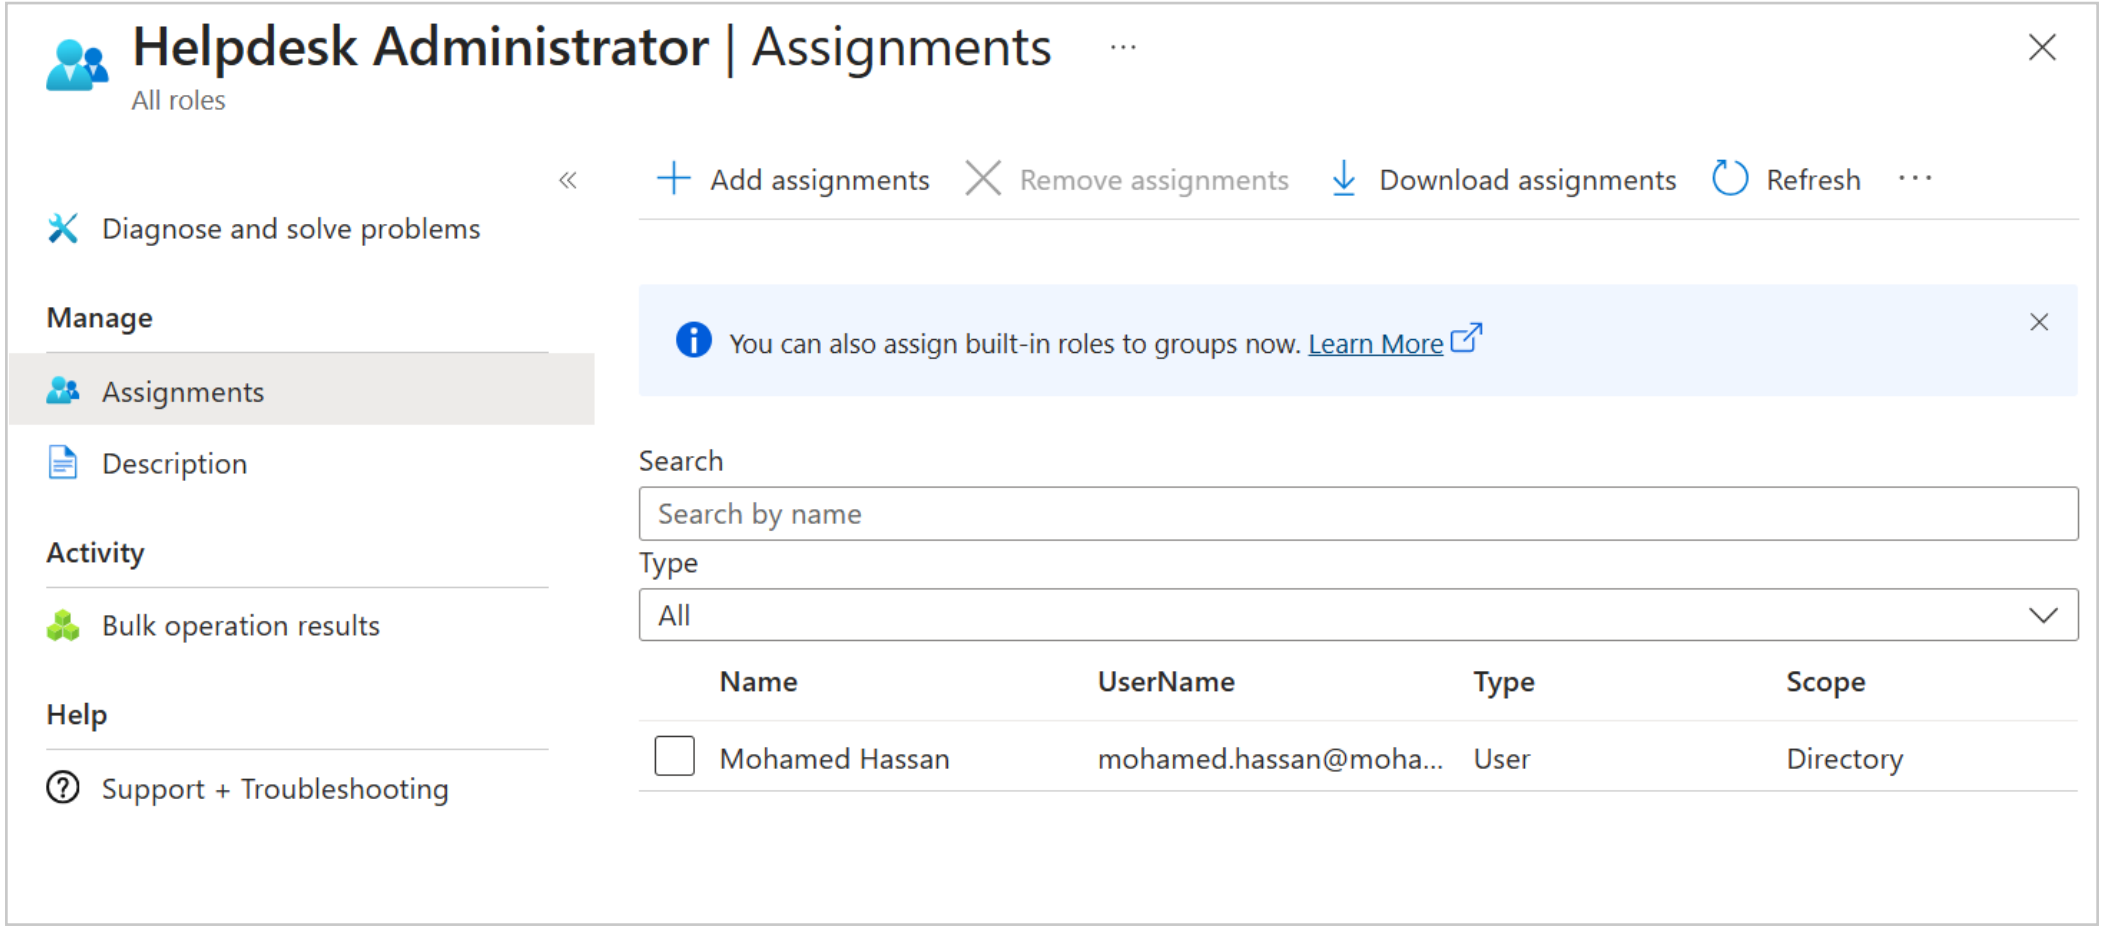

Mohamed Hassan is selected in the list in preparation for removing the role (Remove assignments).

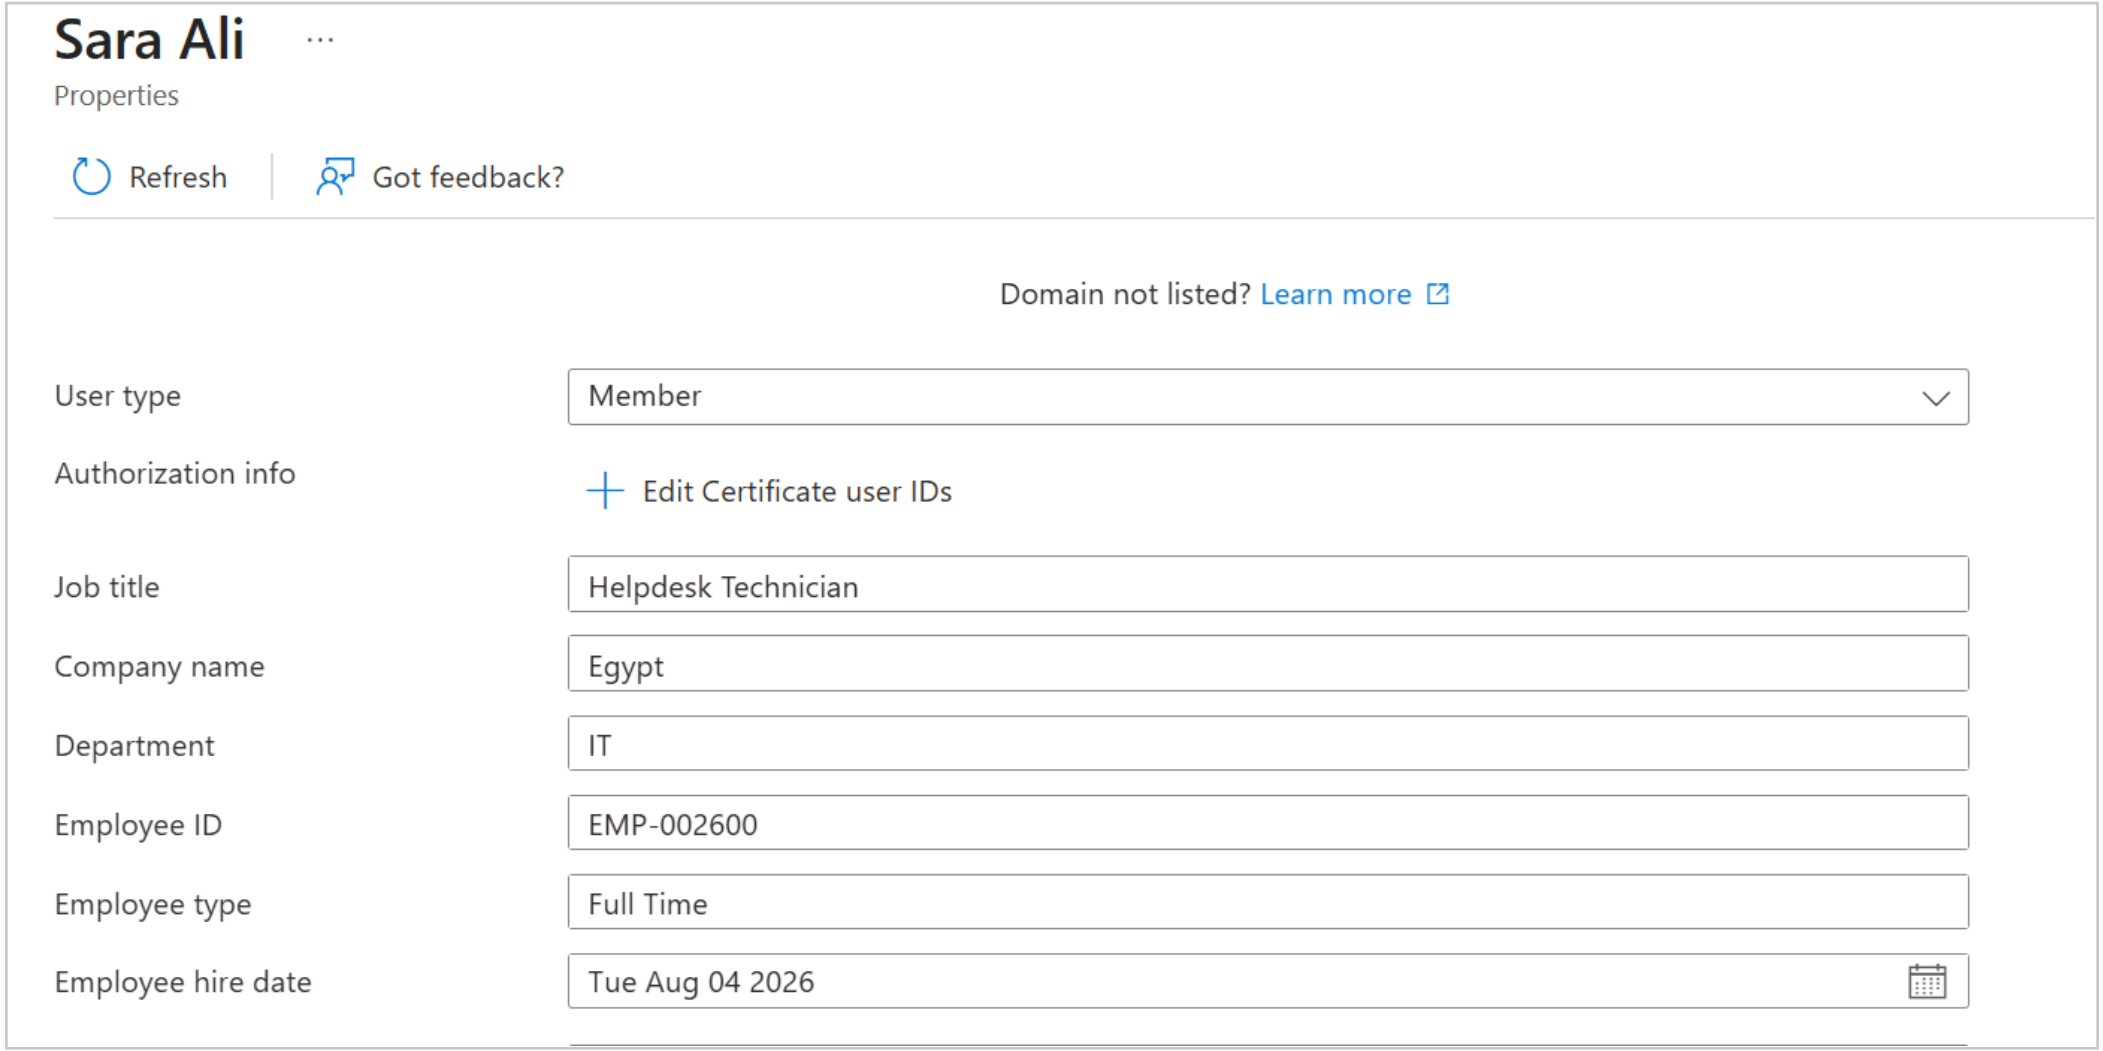

After Removal

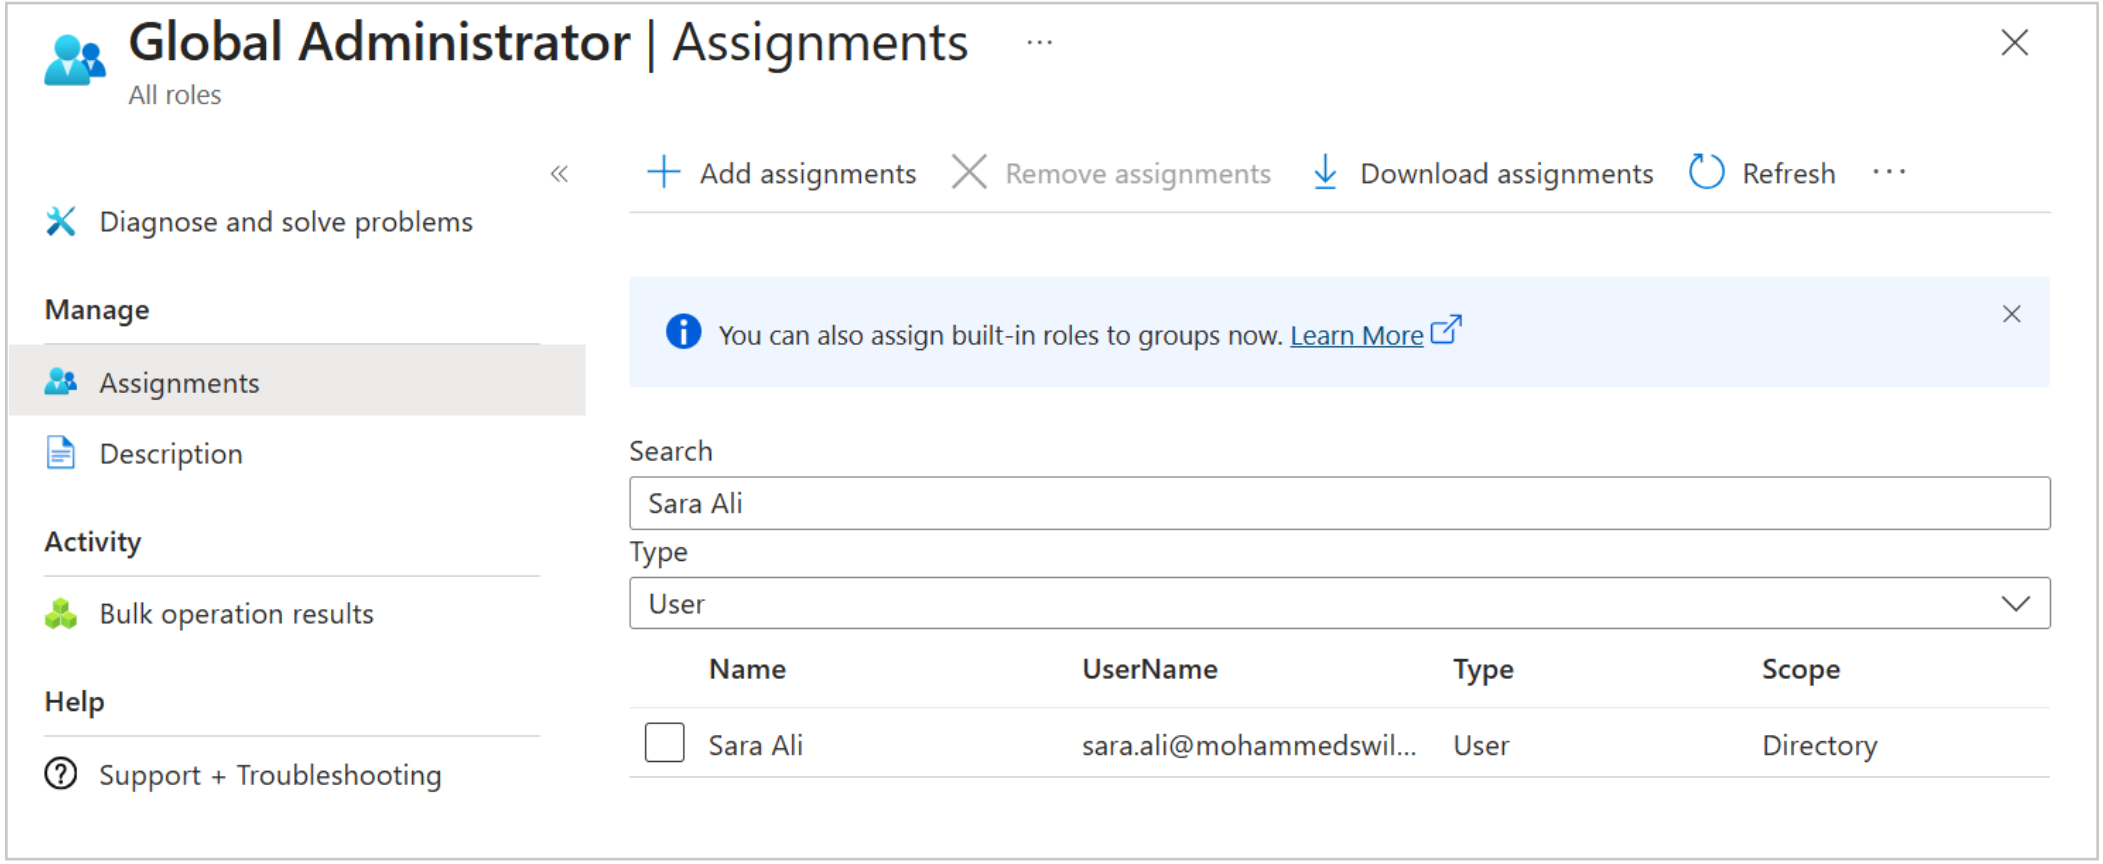

"No role assignments found" confirms the role was removed and nobody holds Cloud App Security Administrator anymore.

Mohamed Hassan is assigned the Helpdesk Administrator role, which fits IT support work (such as password resets) without excessive privilege.

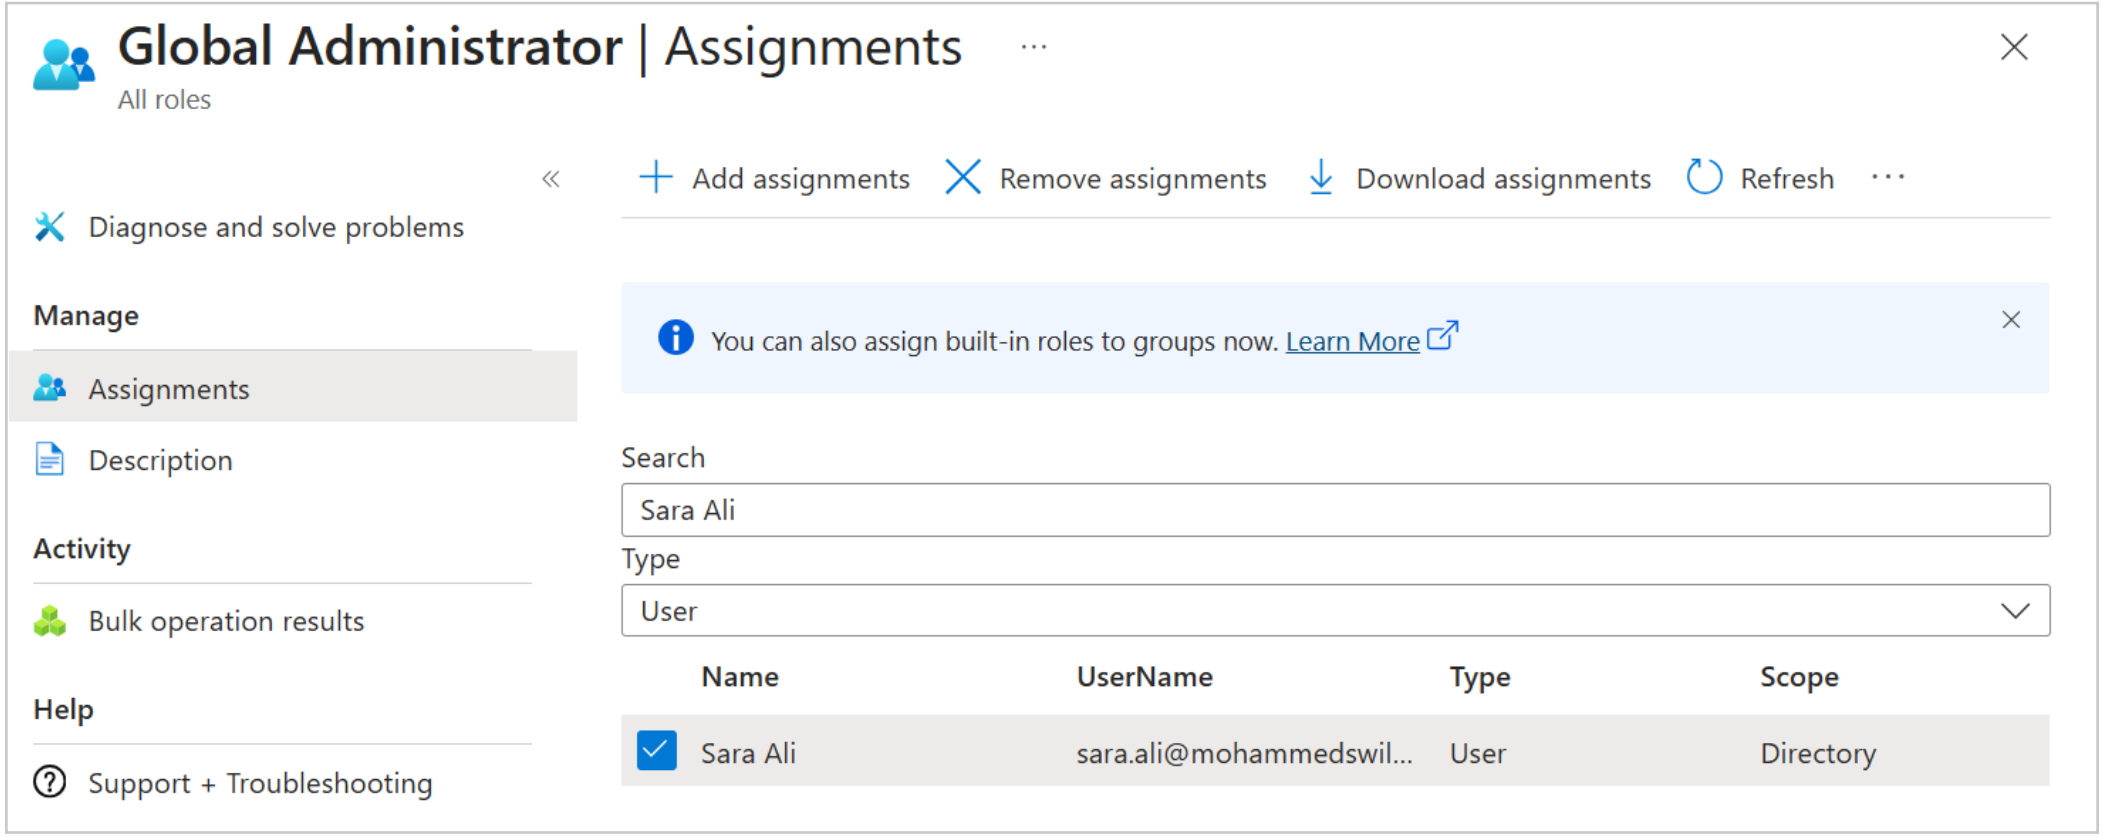

Employee profile: job title Helpdesk Technician, IT department, Employee ID EMP-002600. This is a support role that does not need full administrative rights.

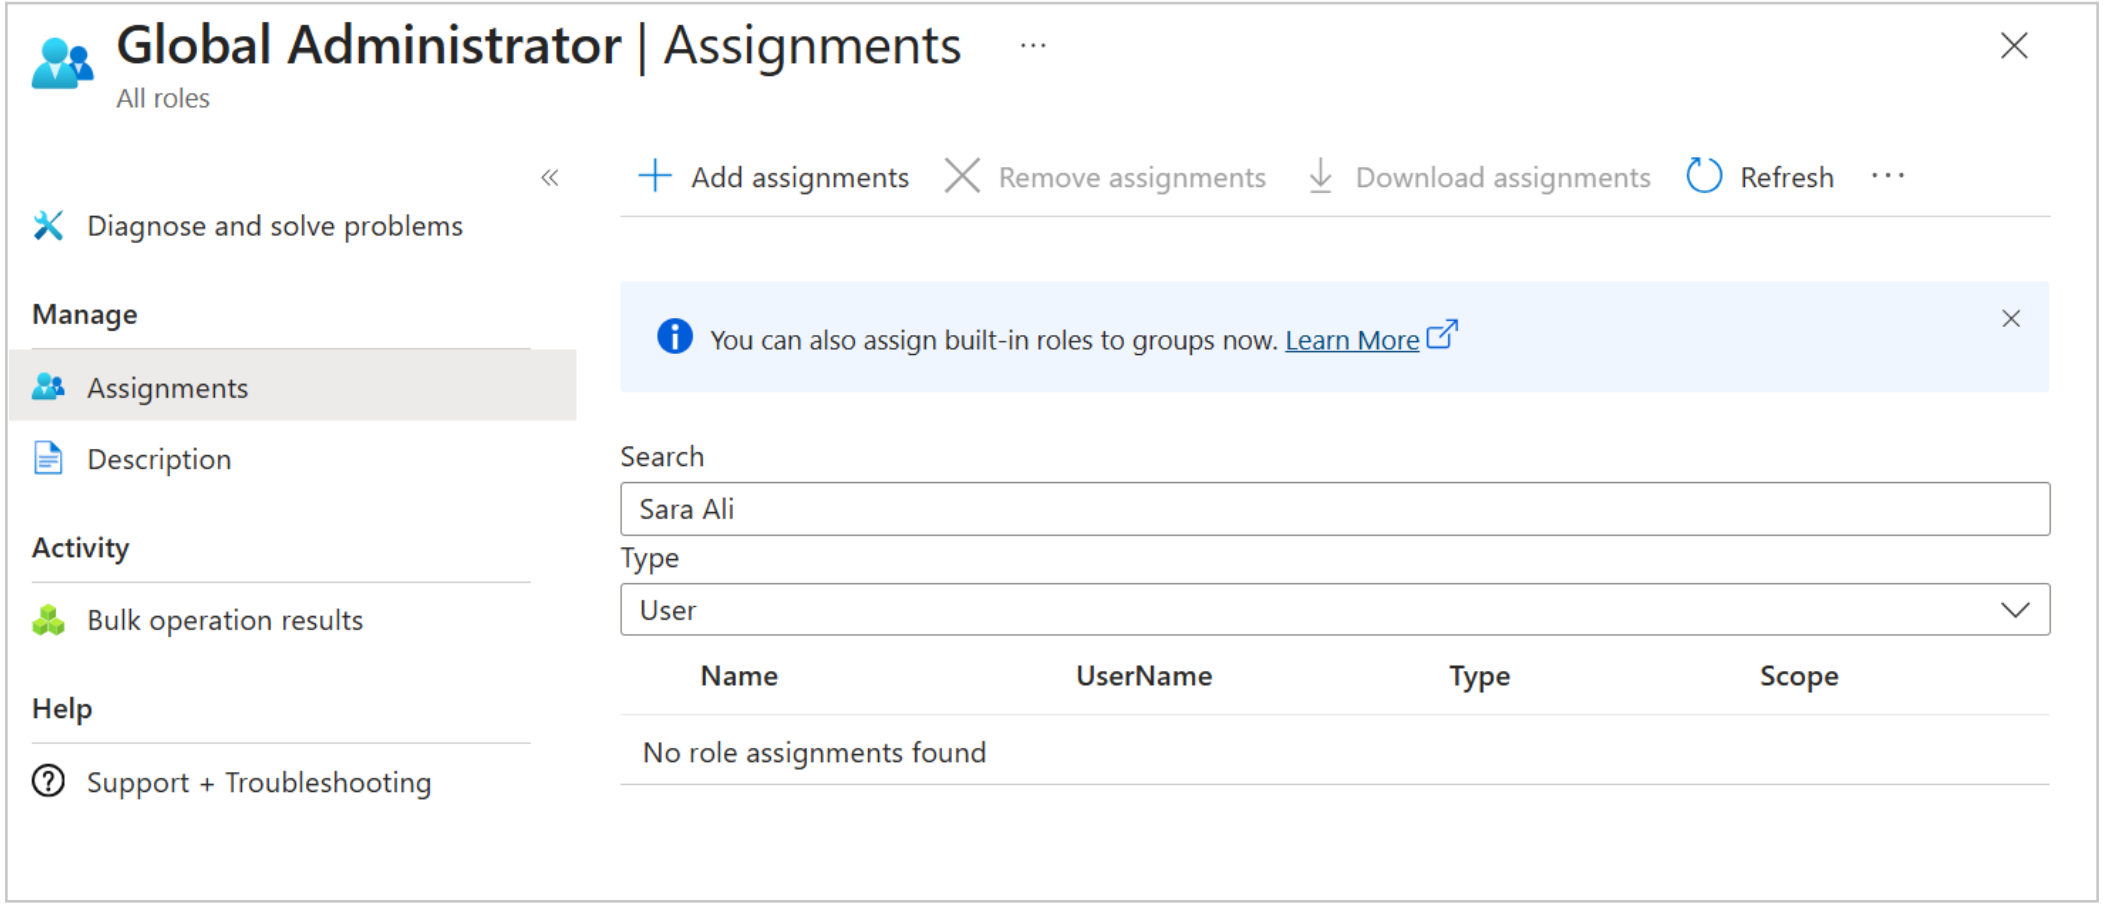

Searching for Sara Ali shows she holds Global Administrator, the highest role in the directory. This clearly violates the principle of least privilege.

Selecting the User for Removal

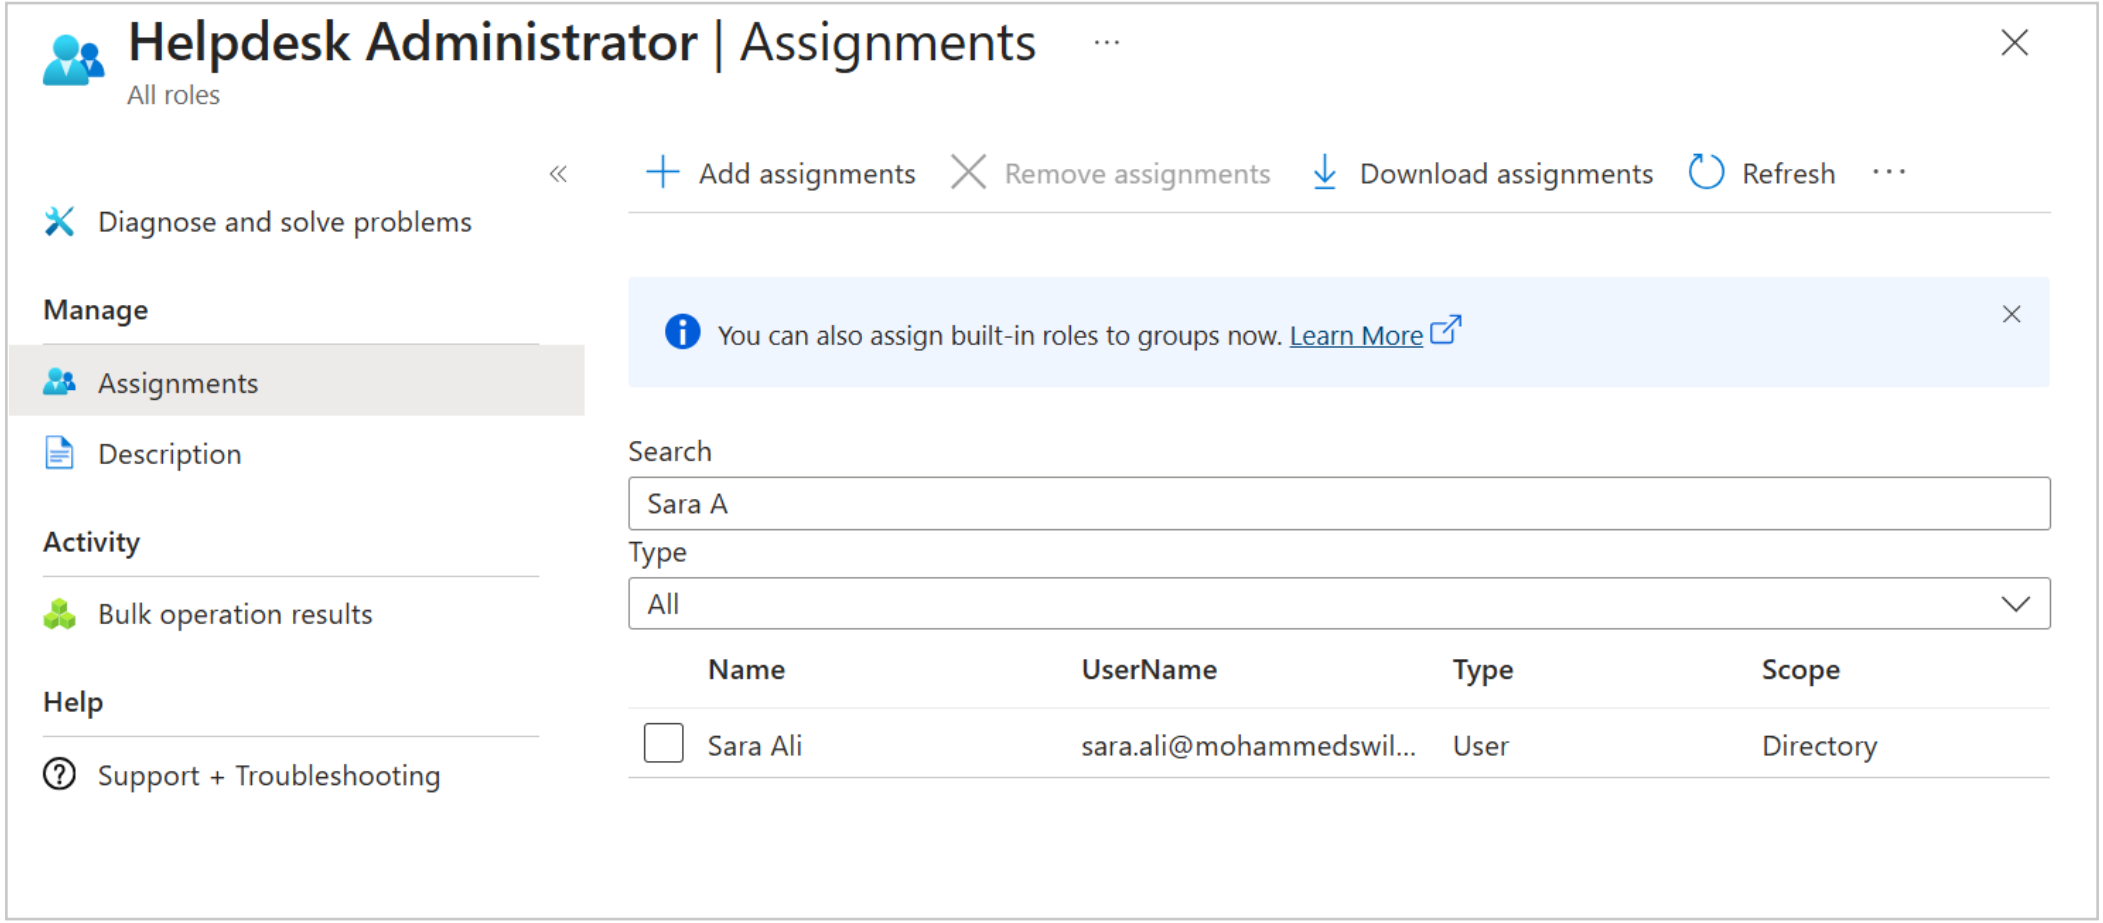

Sara Ali is selected in order to remove the Global Administrator role.

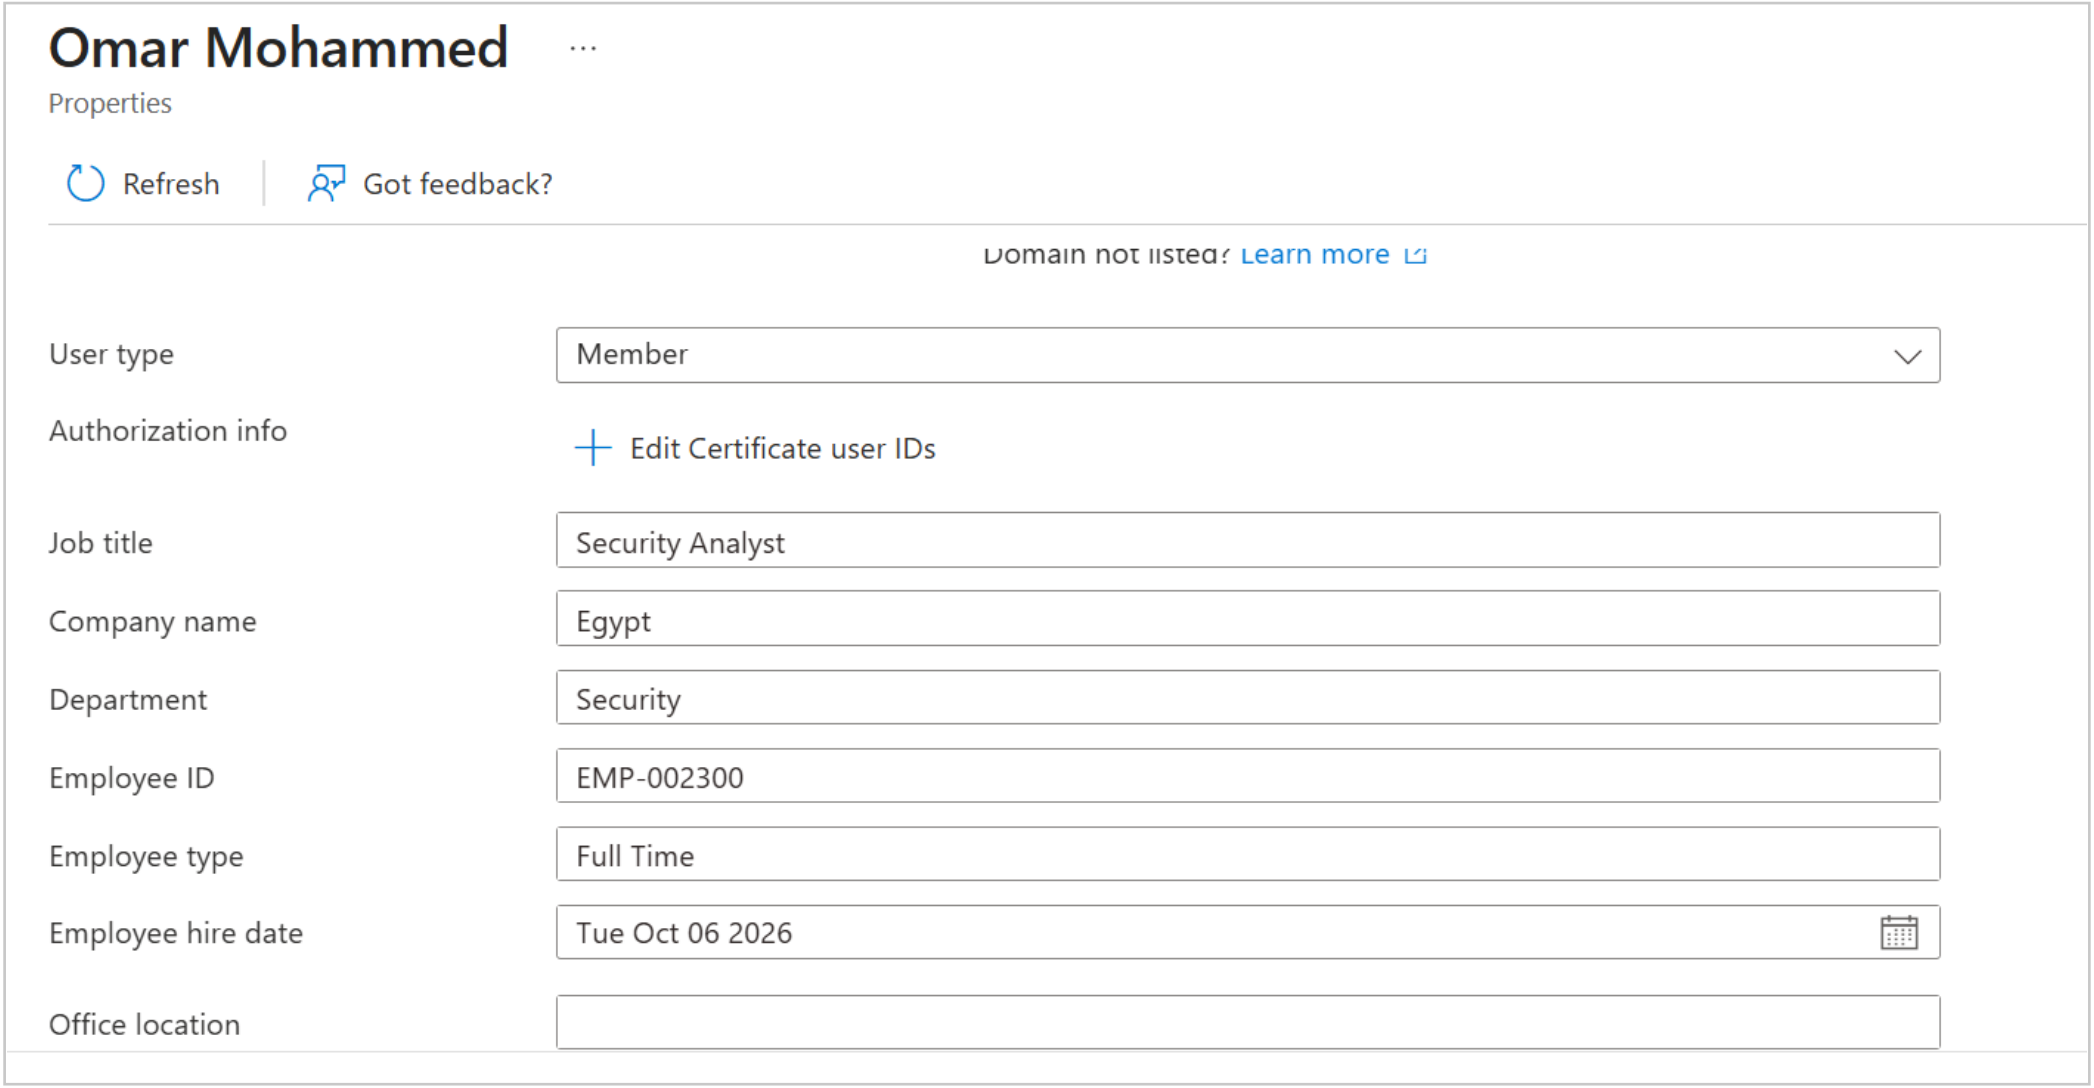

After Removing Global Administrator

"No role assignments found" for Sara Ali confirms the role was fully removed.

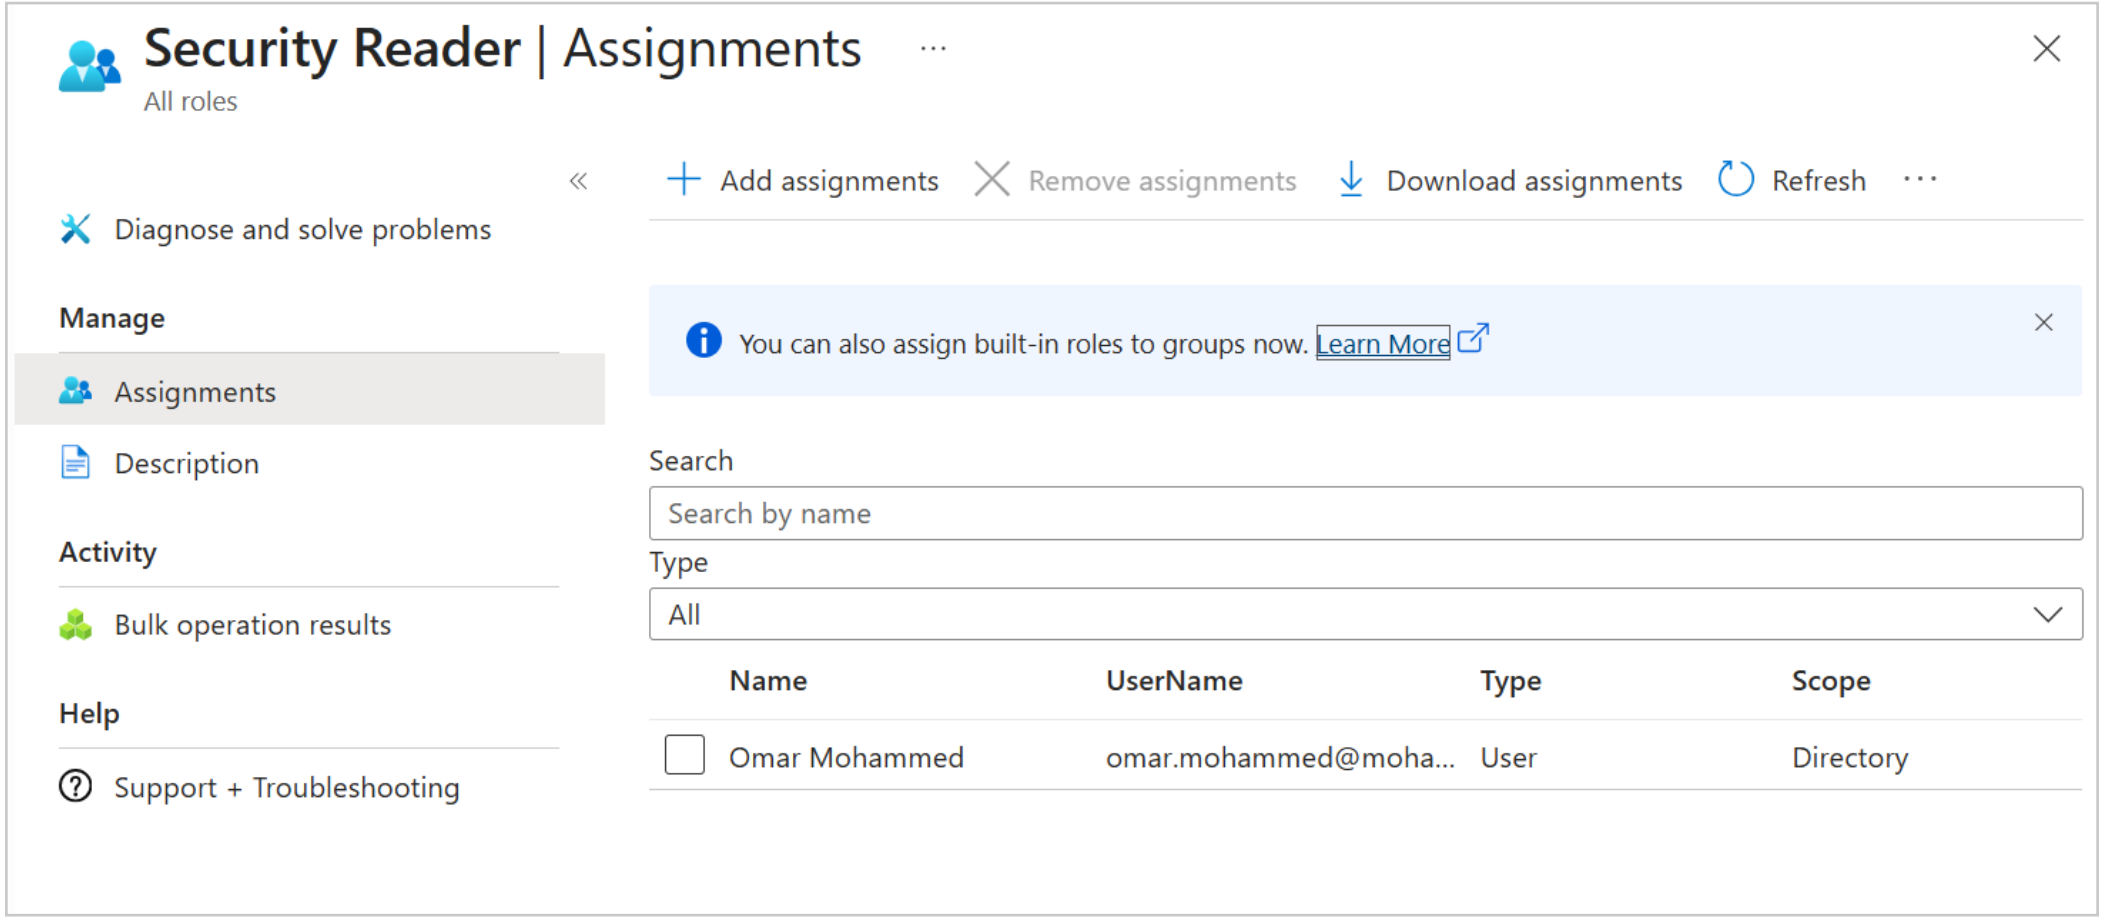

Sara Ali is assigned the Helpdesk Administrator role, which is appropriate for a helpdesk technician.

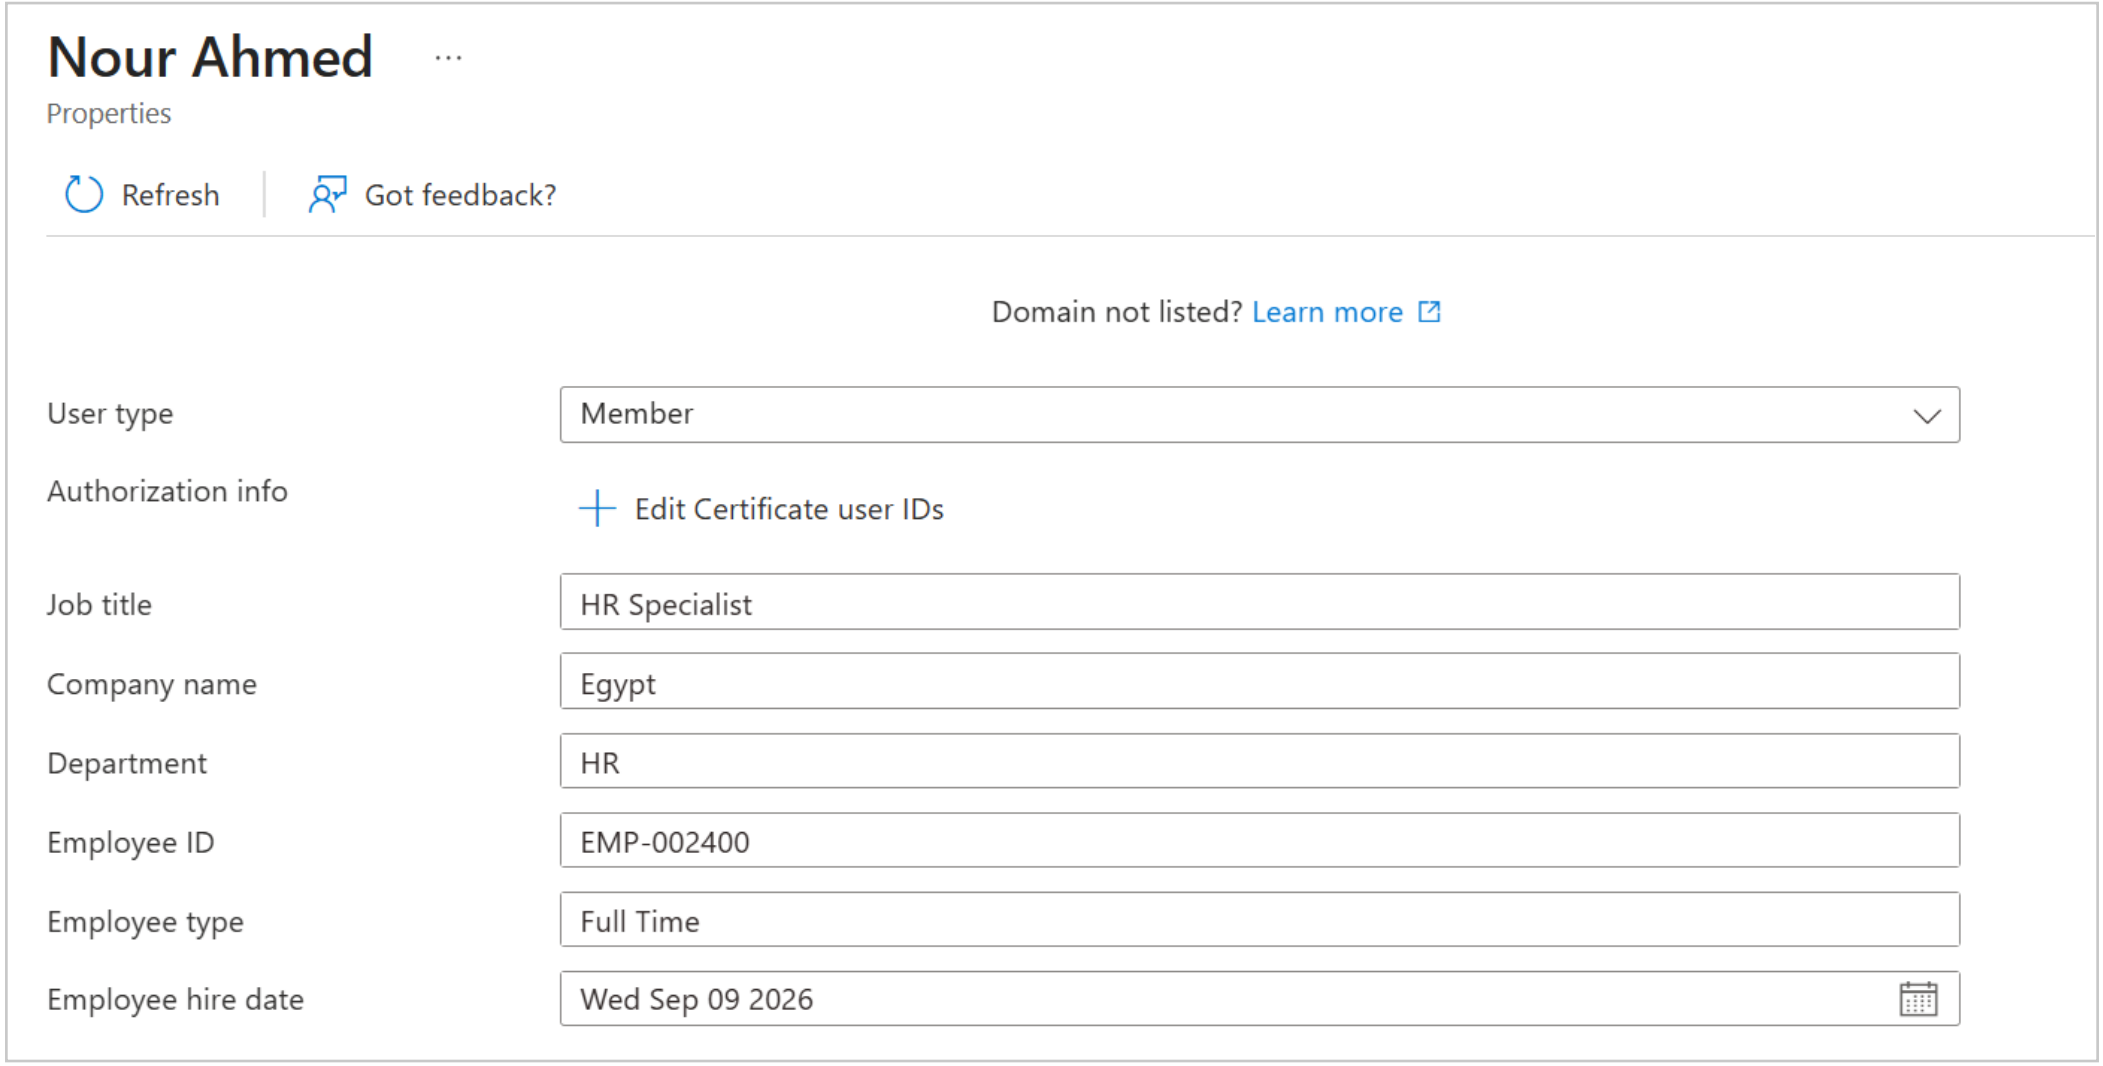

Employee profile: job title Security Analyst, Security department, Employee ID EMP-002300.

Assigning Security Reader

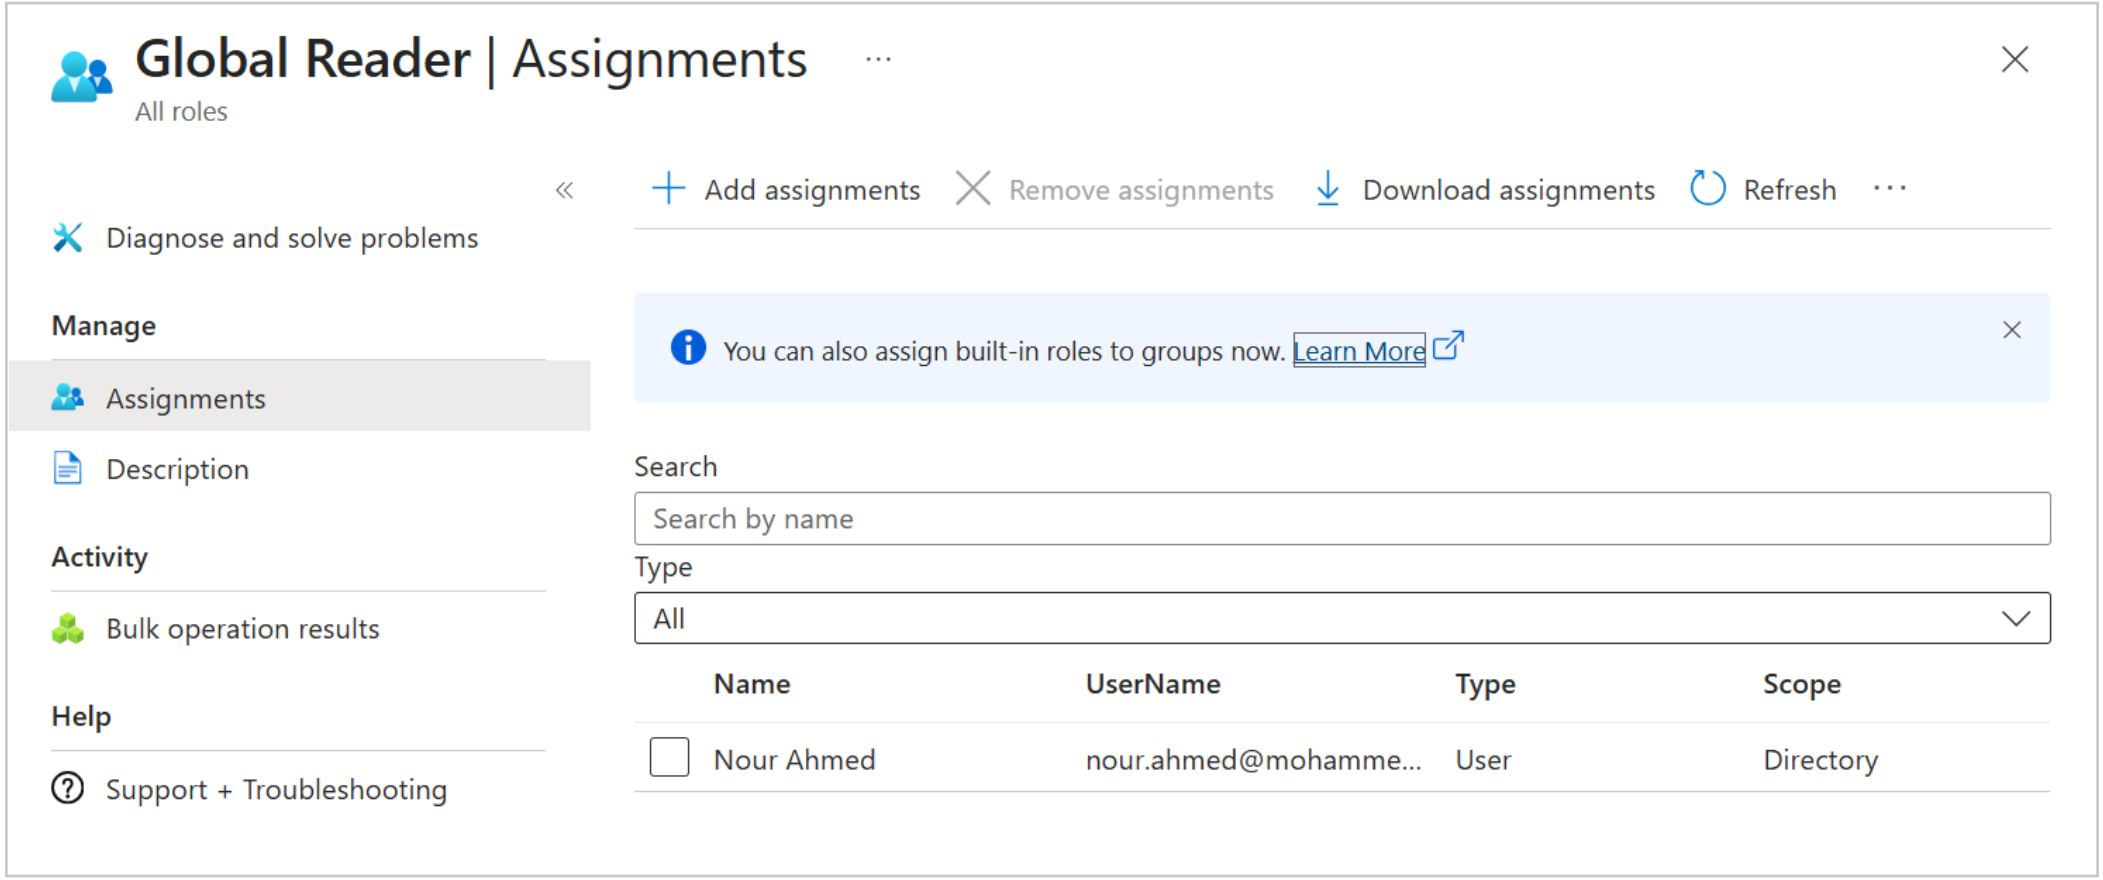

Omar Mohammed is assigned Security Reader, which gives read-only access to security information. This is sufficient for a security analyst.

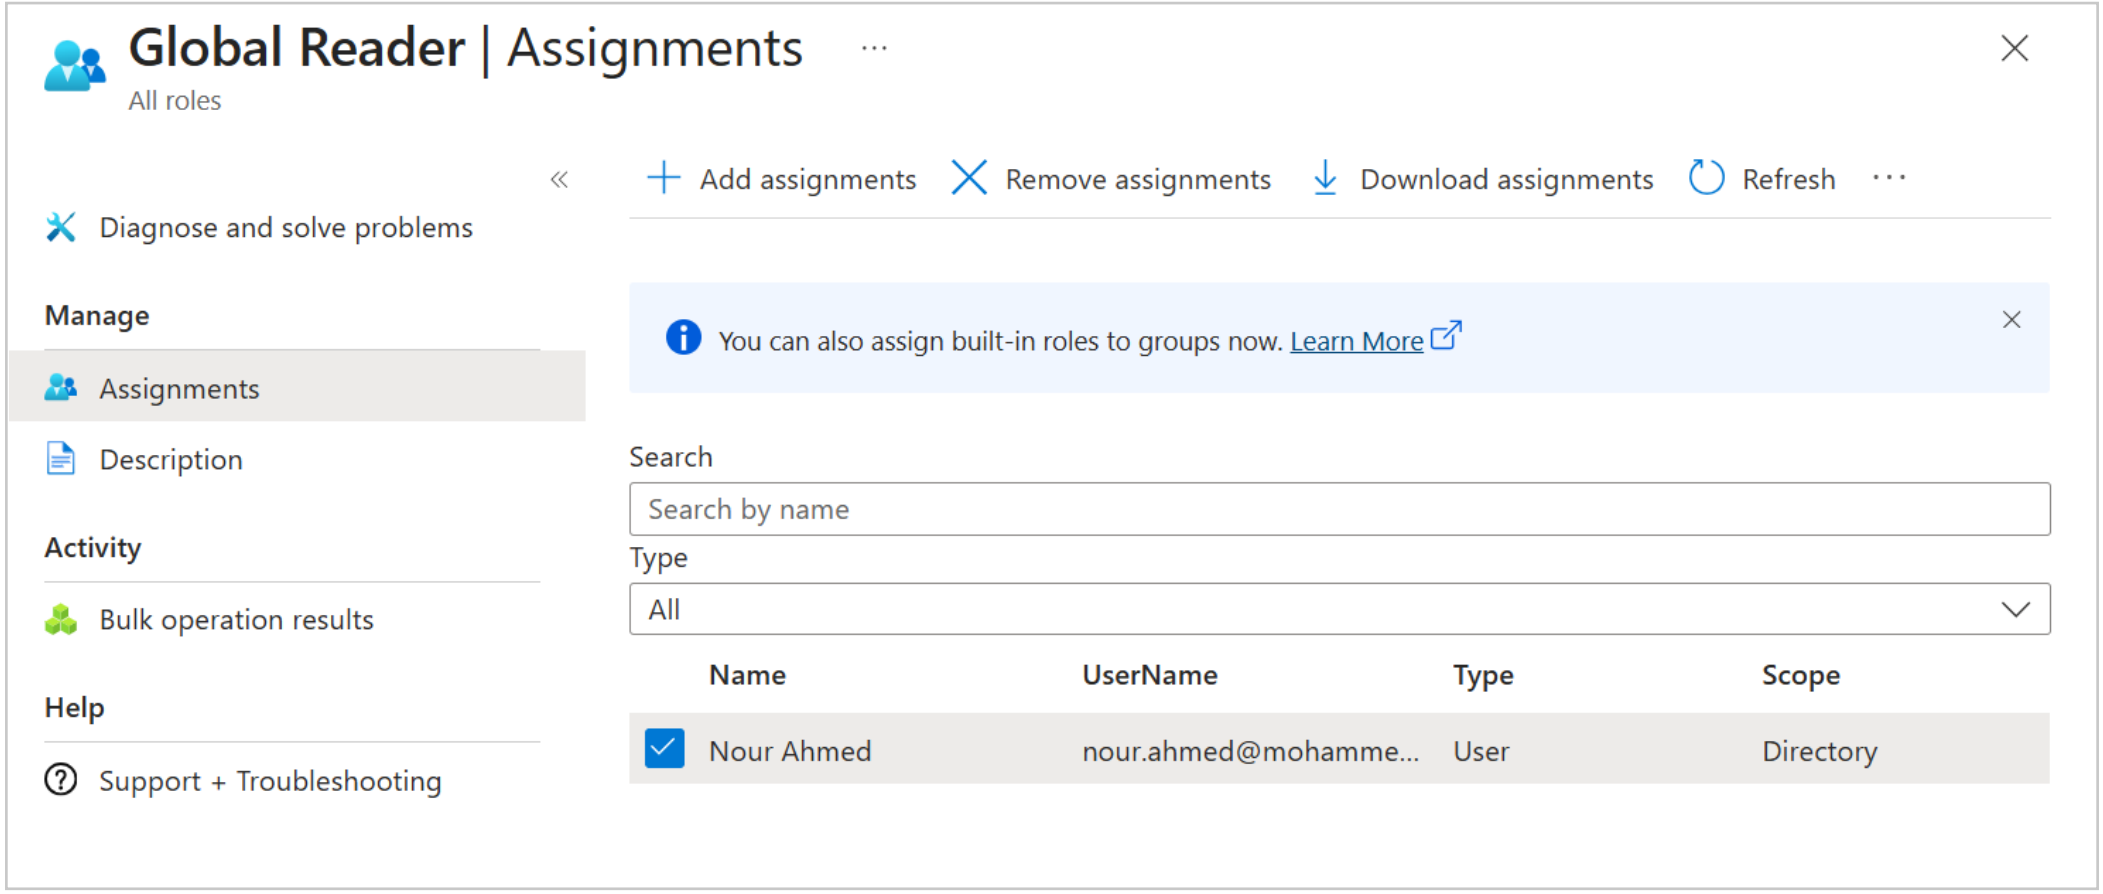

Employee profile: job title HR Specialist, HR department, Employee ID EMP-002400. This role does not need any administrative rights on the directory.

Global Reader: Before

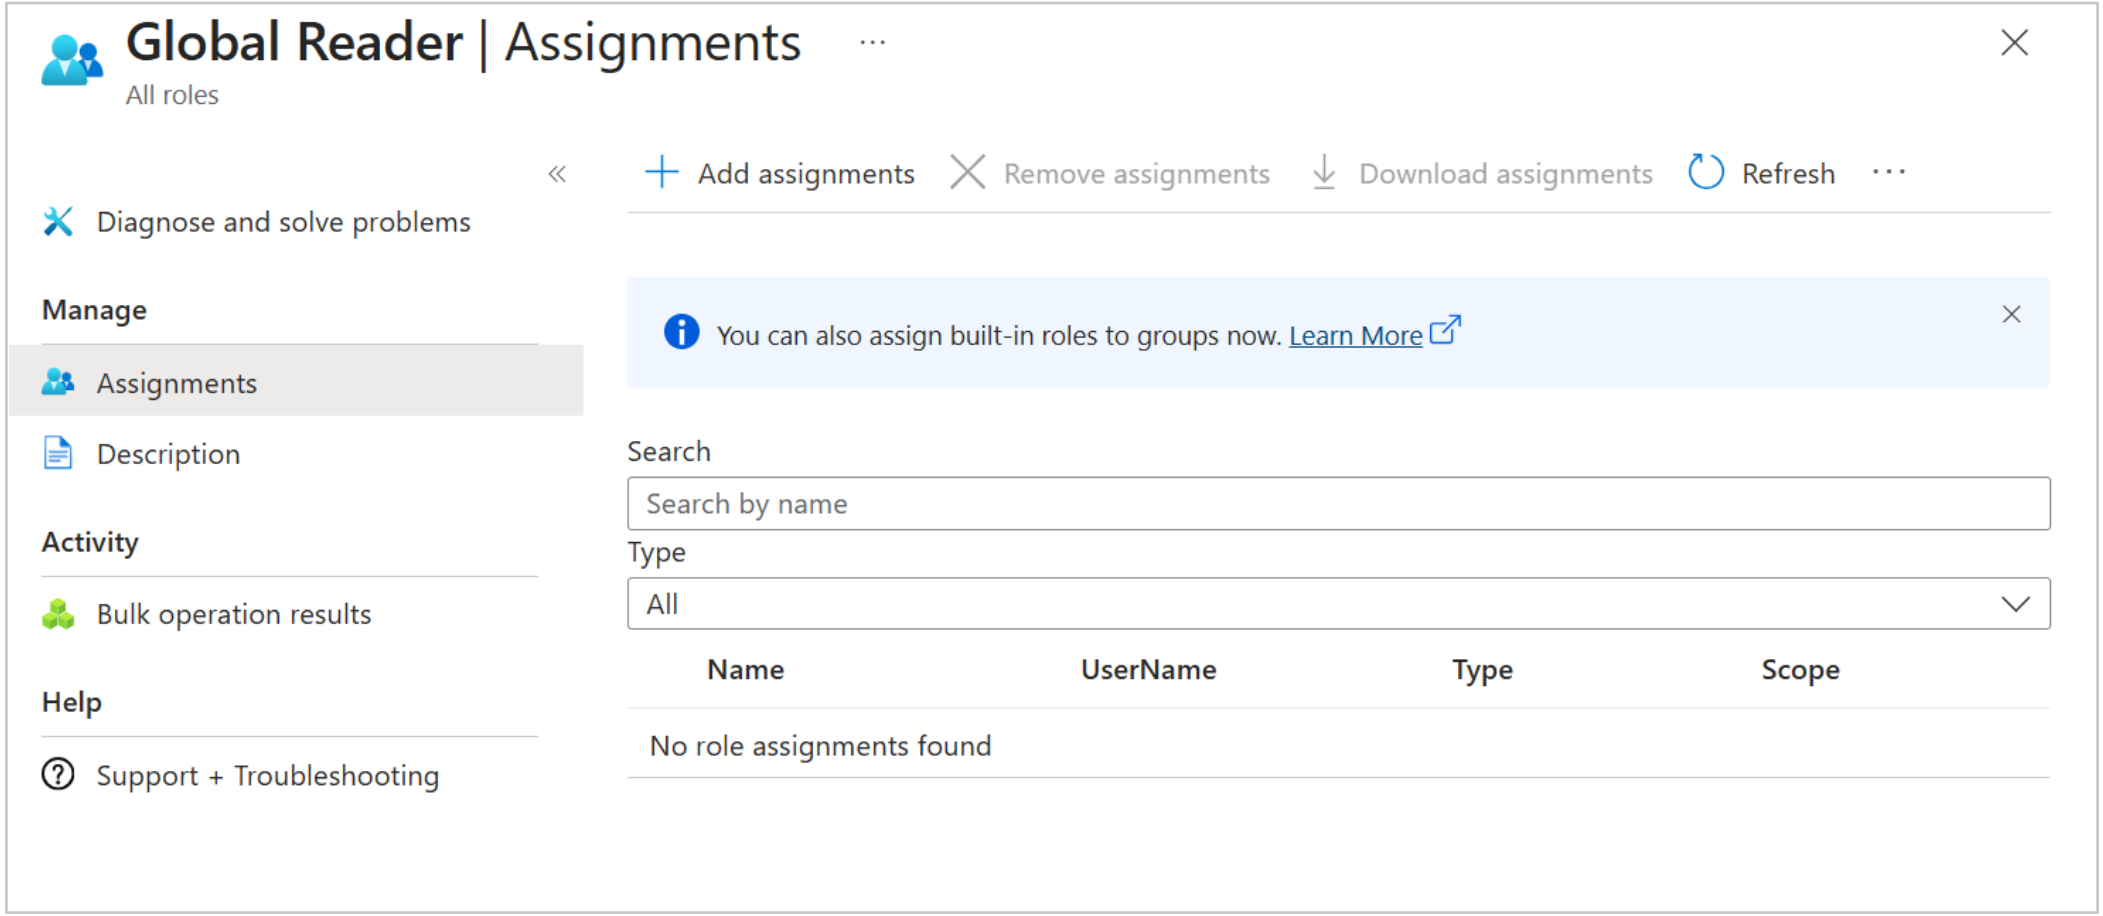

Nour Ahmed holds the Global Reader role, which gives very broad read access to organization settings that she does not need.

Selecting the User for Removal

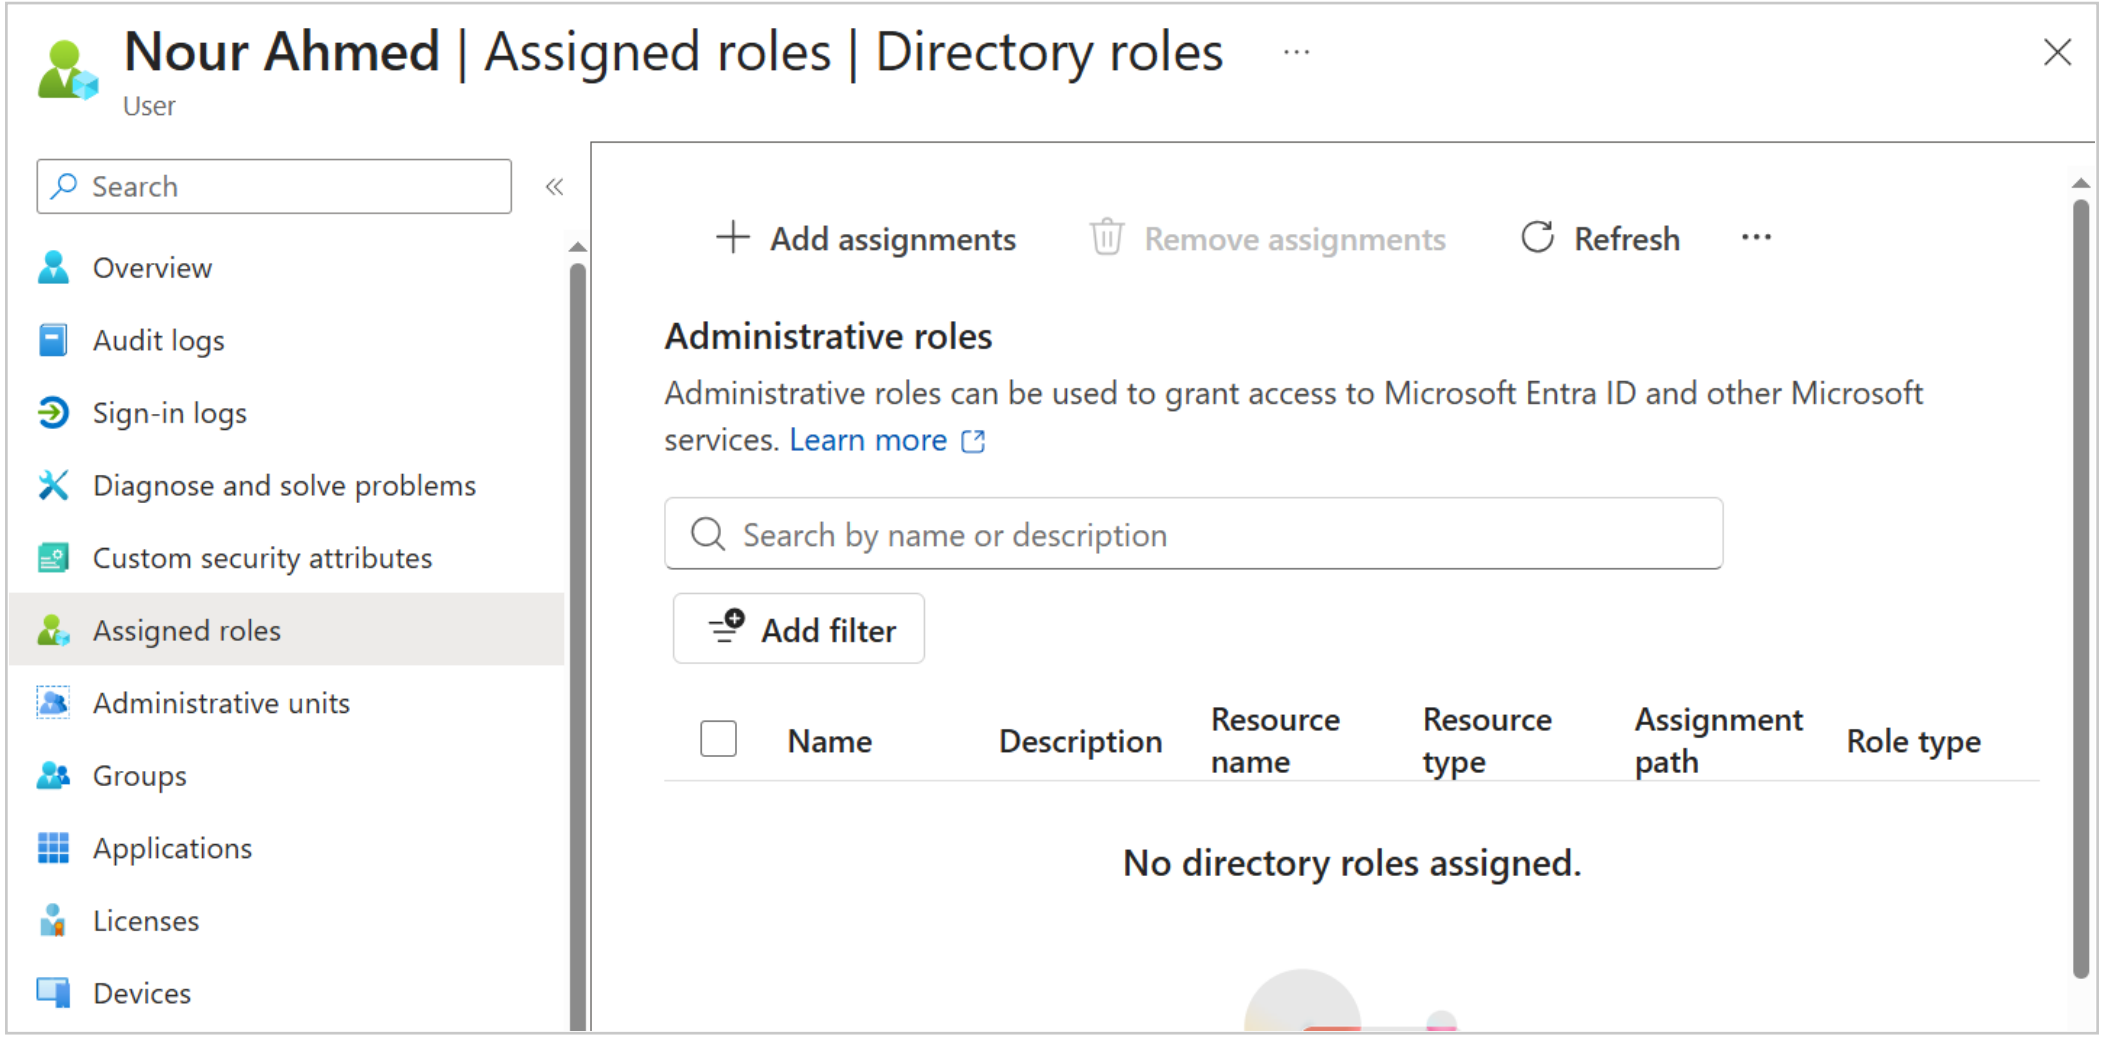

Nour Ahmed is selected in order to remove the Global Reader role.

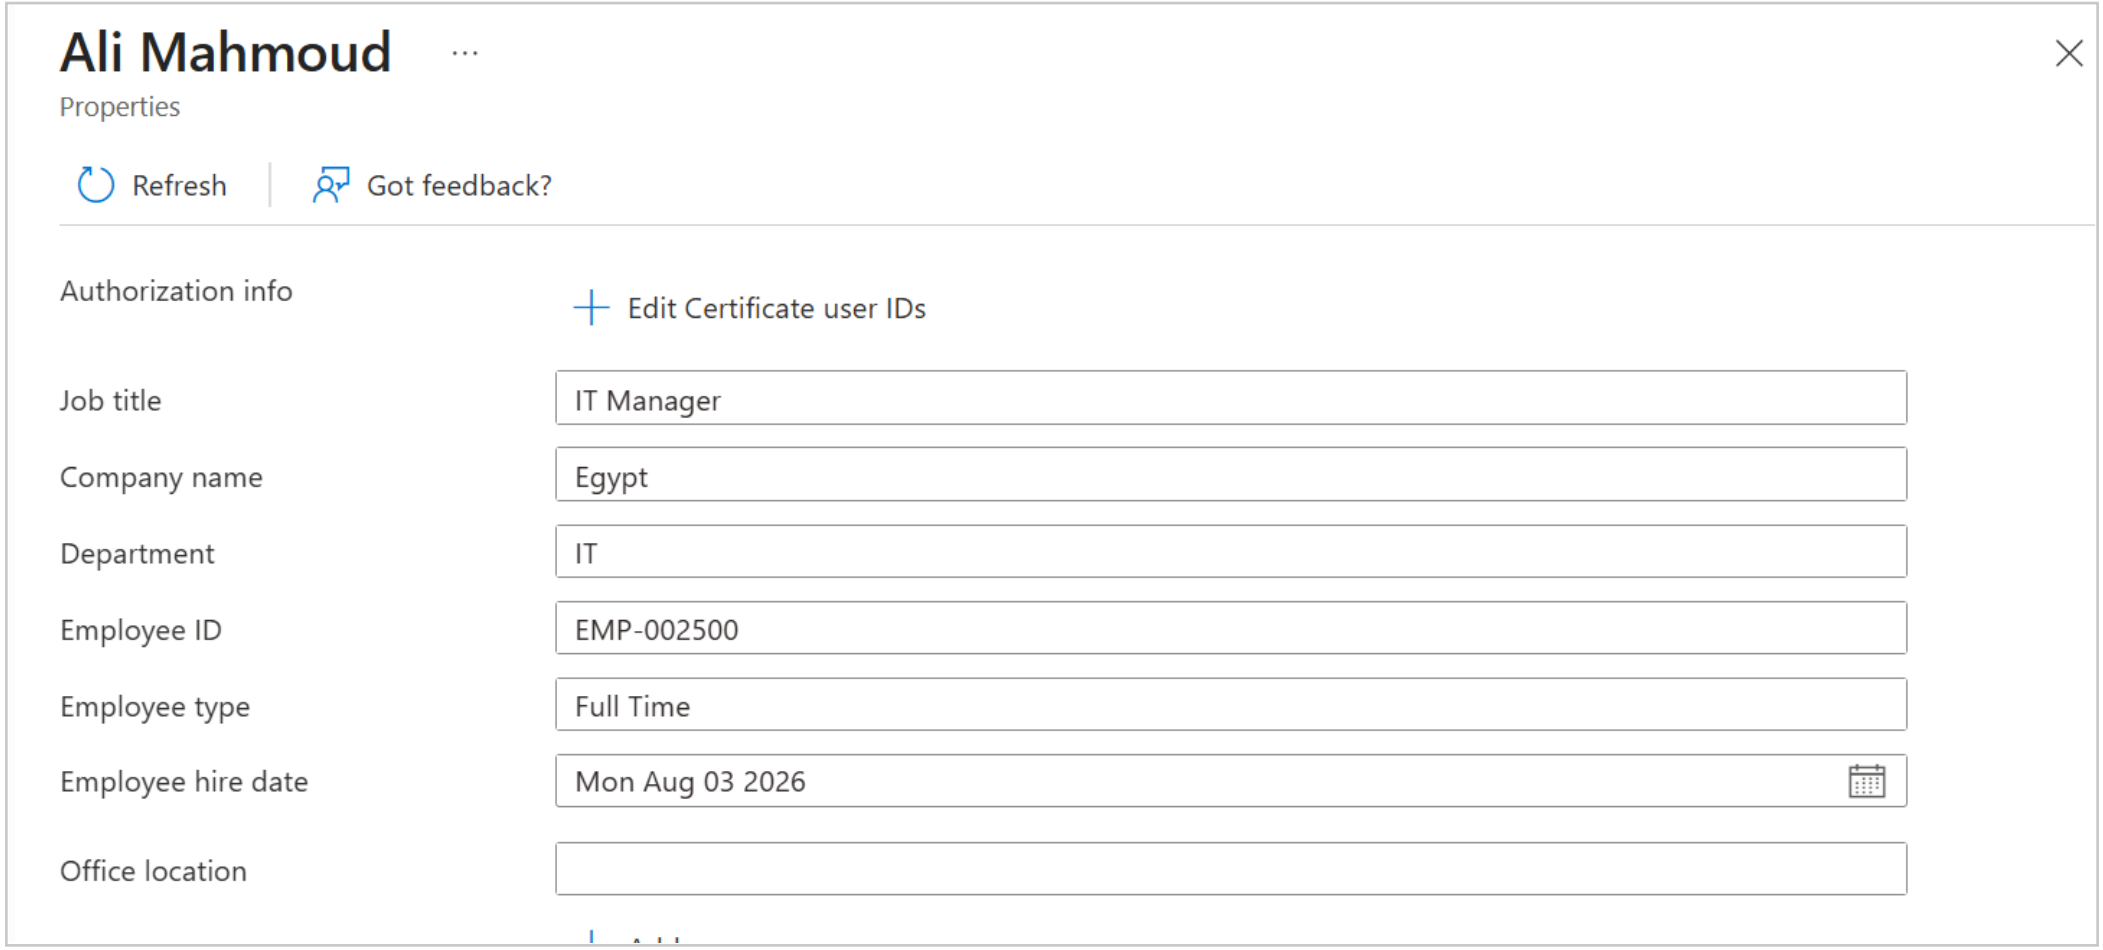

After Removing Global Reader

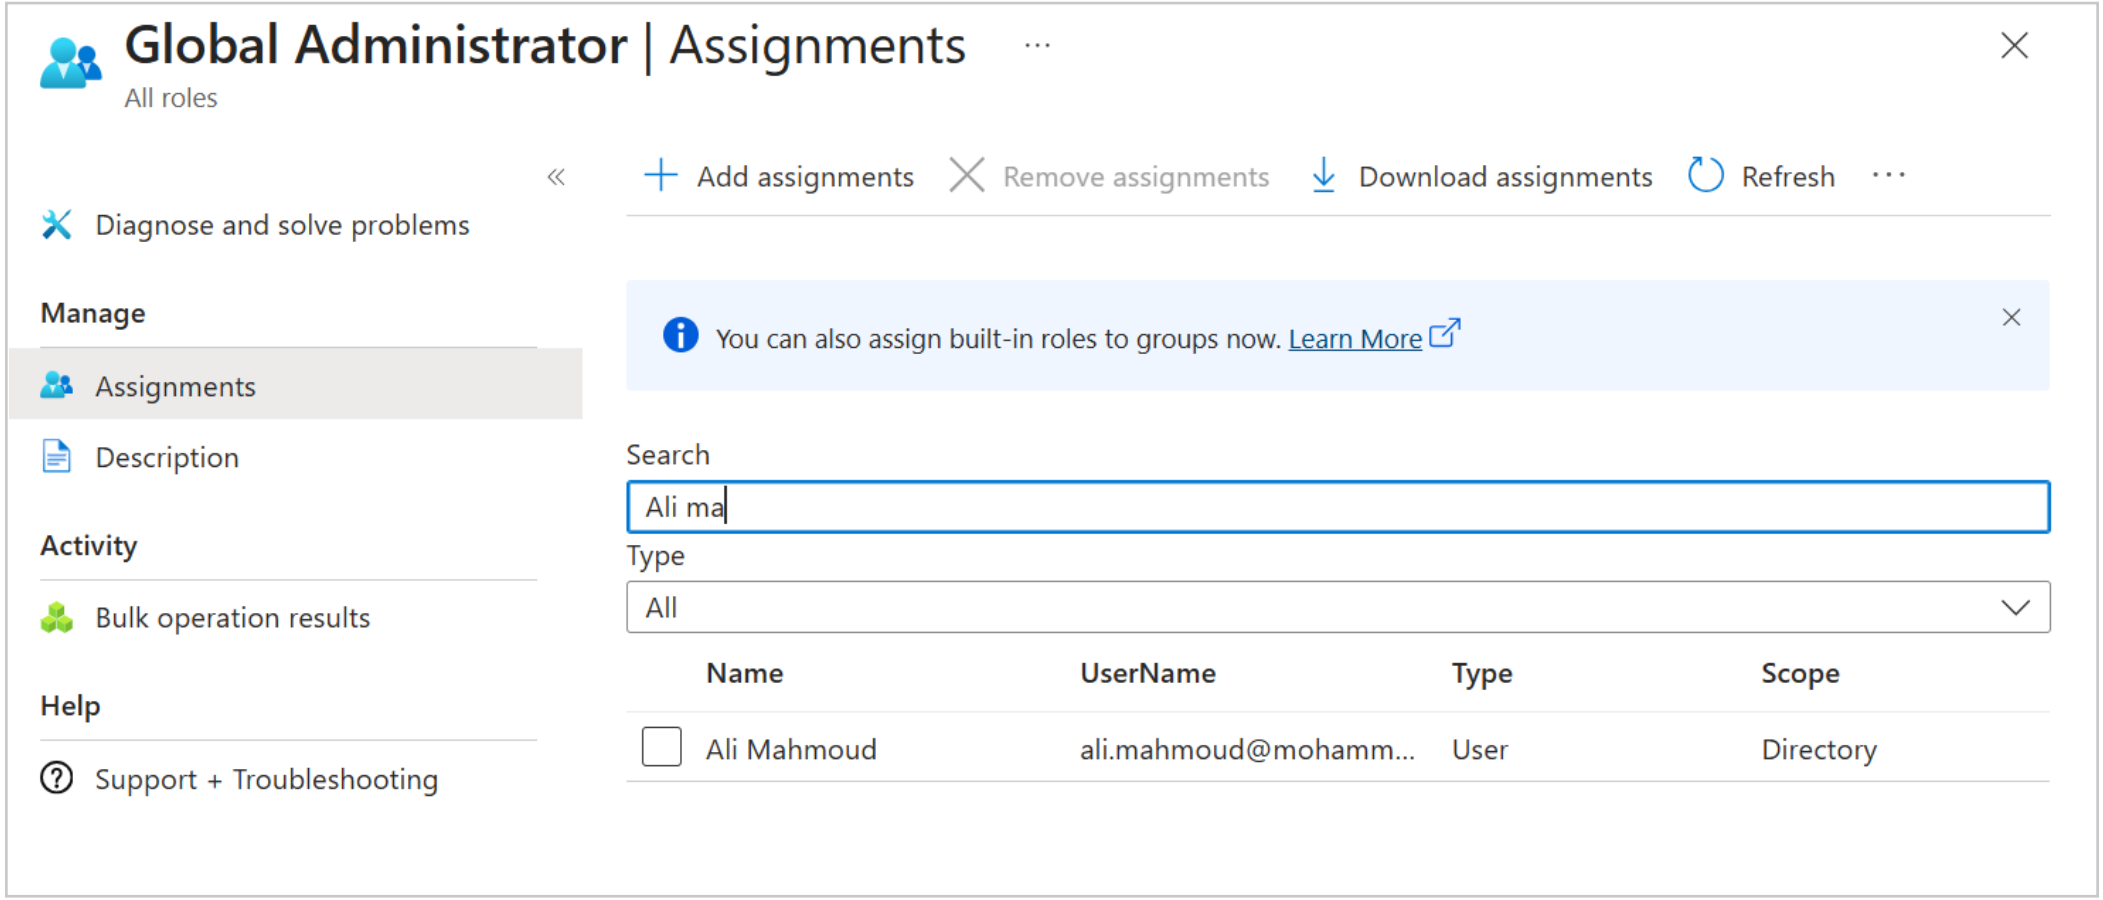

"No role assignments found" confirms no user holds Global Reader anymore.

On the user's Assigned roles page, "No directory roles assigned" confirms Nour Ahmed has no administrative role, which is correct for an HR specialist.

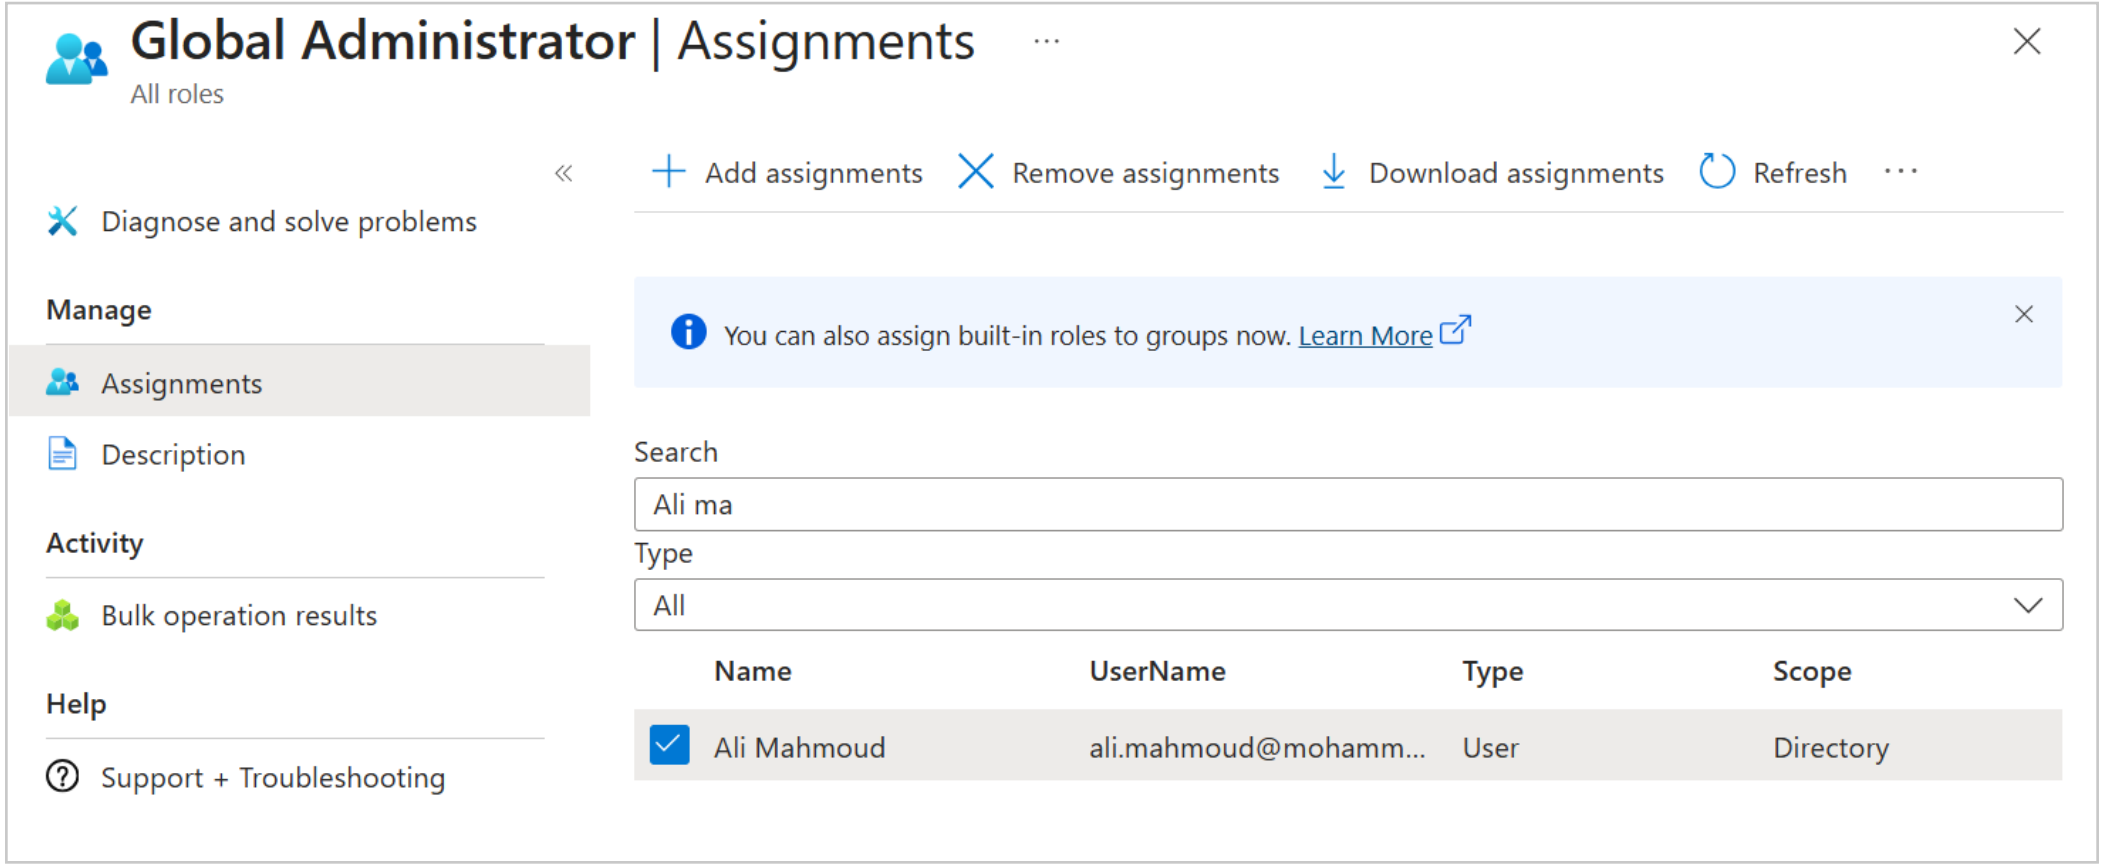

Employee profile: job title IT Manager, IT department, Employee ID EMP-002500.

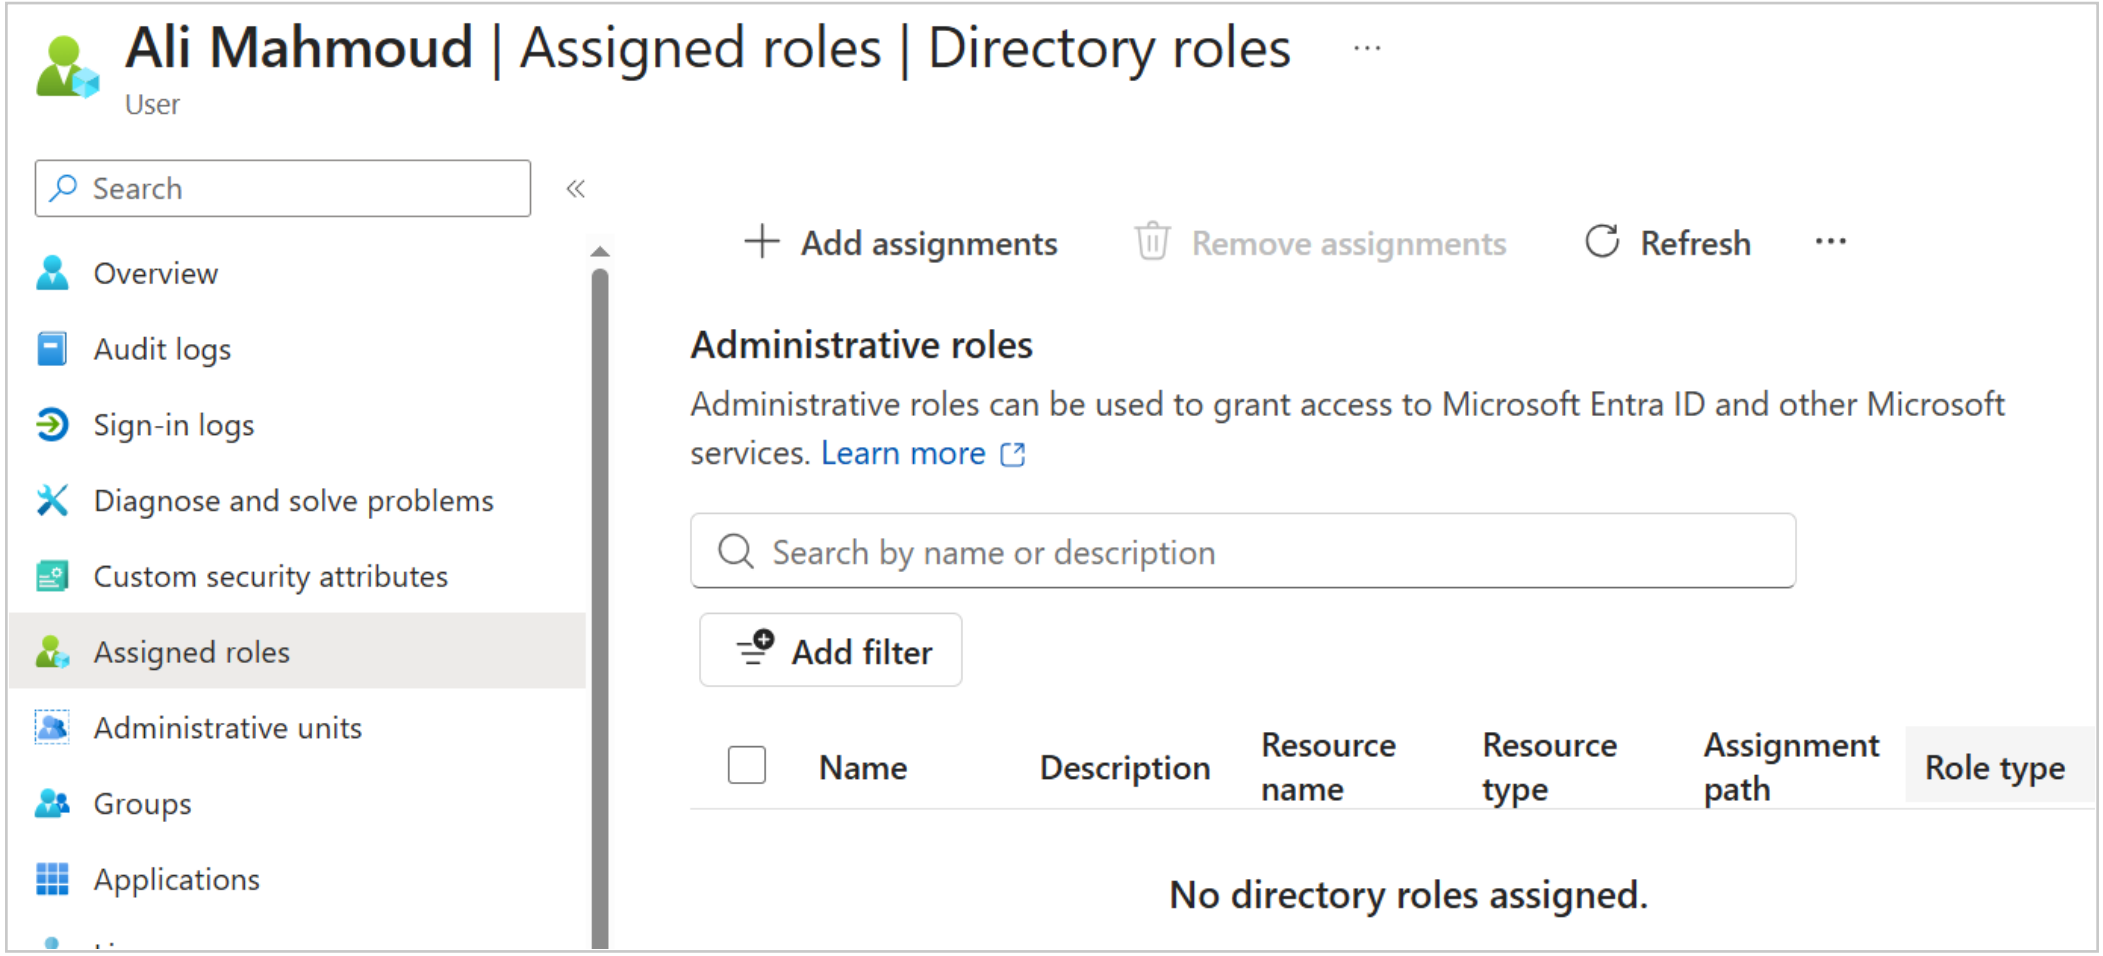

Searching for Ali Mahmoud shows he holds Global Administrator, the highest privilege level, which is unnecessary for day-to-day IT management.

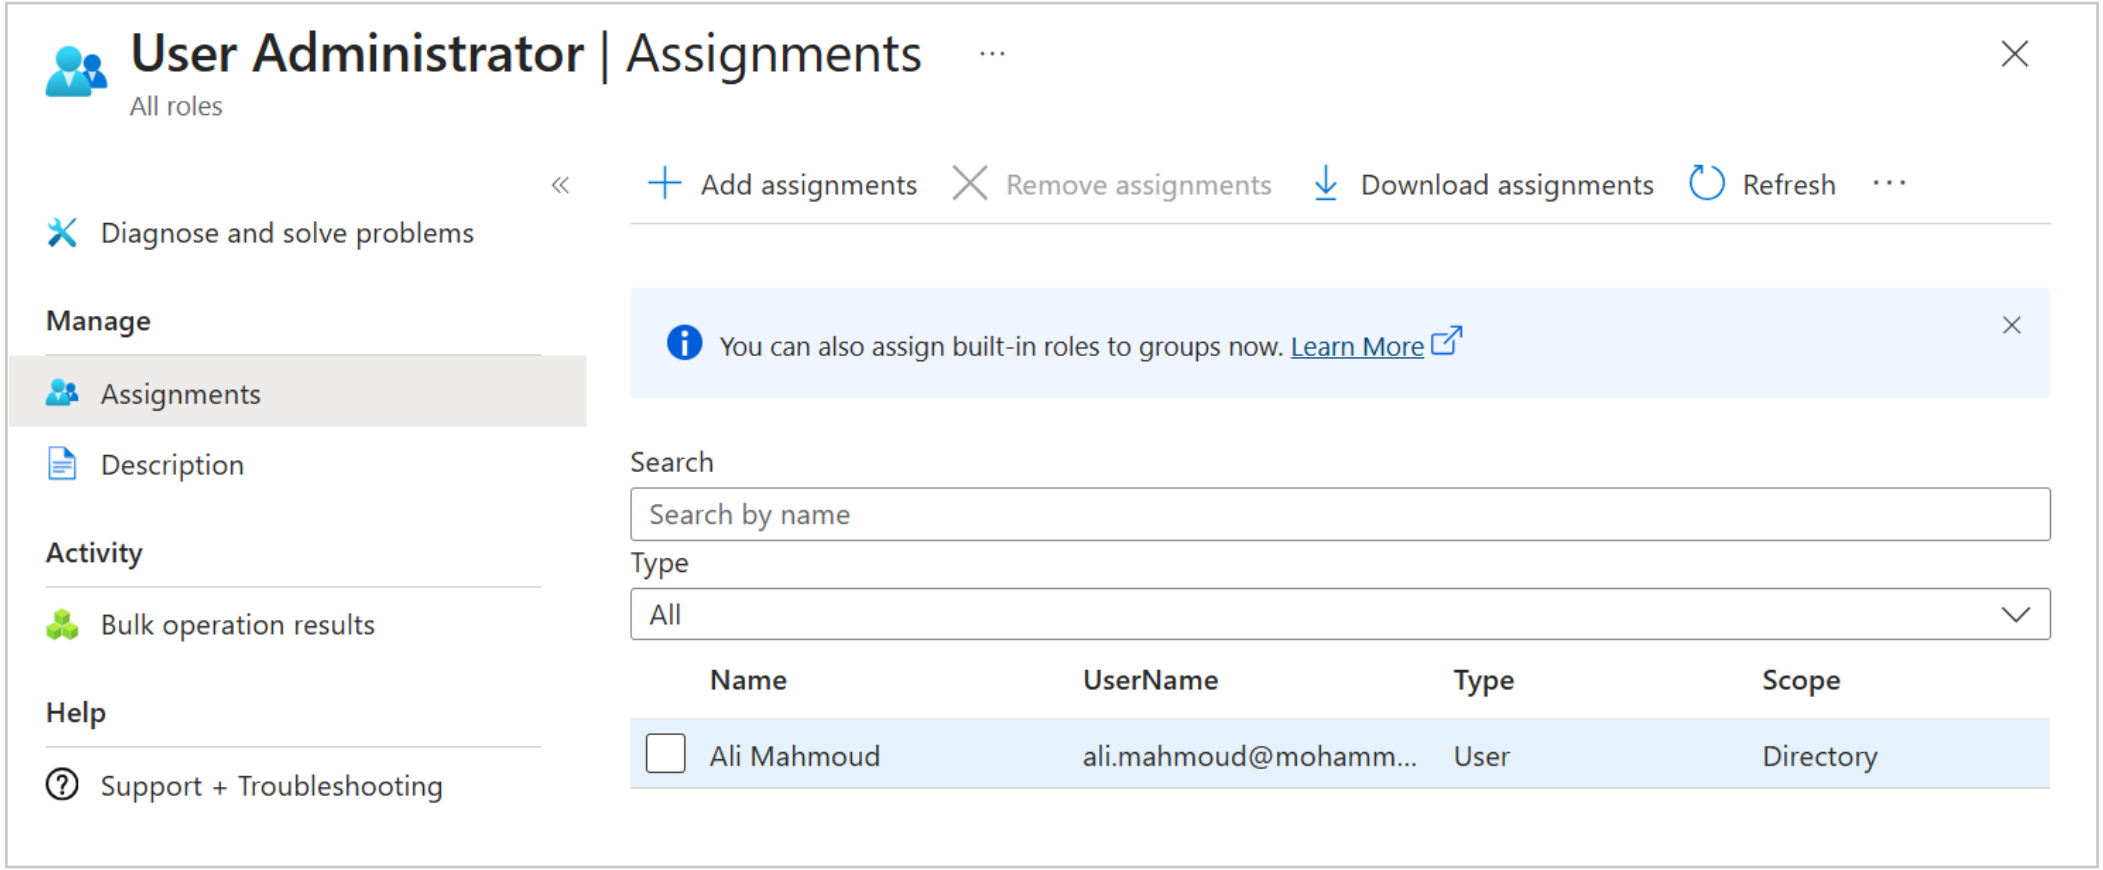

Selecting the User for Removal

Ali Mahmoud is selected in order to remove the Global Administrator role.

Ali Mahmoud's Assigned roles page shows "No directory roles assigned", confirming the role was removed before assigning a more suitable one.

Ali Mahmoud is assigned User Administrator, which lets him manage users and groups without the full power of Global Administrator.
